## PARTS ORDERING PROCEDURE

WHEN ORDERING PARTS, INCLUDE THE FOLLOWING INFORMATION:

1. Shipping address.
2. Address where the invoice should be sent.
3. The part number or part identification.
  - a. Always refer to the pertinent parts and service manual(s) for the correct part number and part description. If you do not have the right parts manual at the time you order contact THE VENDO COMPANY at 7209 N. INGRAM, FRESNO, CALIFORNIA, 93650 or call (800) 344-7216 or in California call (800) 742-1815 for our parts department.
  - b. Do not hold the order pending receipt of the parts manual. Use as complete of a description as you can. Include the model and serial numbers of the machine, name of the assembly in which the part is used and, if practical, a sample part. Also furnish any further information that will enable our parts department to pinpoint the exact part needed.
4. The quantity of parts required.
5. Always include on the order the model number, and the serial number of the machine for which the parts are needed.
6. List any special shipping instructions.
  - a. Always note on the order if you require United Parcel Service (UPS), Air, Air Special, Truck or Parcel Post shipping. Normal mode of shipping from Vendo is UPS ground.
  - b. If a specific carrier is desired, also note that on the order.
  - c. Freight charges will be added to the parts invoice.
7. Sign and date the order. Keep a copy for your records.
8. When a purchase order is used, be sure that it is legible and visible.
9. Mail your order to: THE VENDO COMPANY, 7209 N. INGRAM, FRESNO, CALIFORNIA 93650.
10. All orders are carefully packed and inspected prior to shipment. Report any packing list discrepancies to parts department within 5 days of receipt of order. Damage incurred during shipping should be reported at once and a claim filed with the terminating carrier.

NOTE: When "right" and "left" are used in connection with the name of a part, it is taken to mean that the person is facing the vender with ALL doors closed.

## MATERIAL RETURN PROCEDURE

All items returned must be accompanied by material return tags (P/N L1496) clearly stating the reason for return. (Tags are available from our parts department upon request). To replace an inoperative part, please use the following instructions.

1. If a spare part was taken from your available parts stock and used to replace in operative part.
  - a. Complete the return tag making sure to fill in ALL requested information.
  - b. Keep top (white) copy for your records.
  - c. Attach tag to inoperative part and send it by the cheapest method of transportation, (usually UPS ground), to: THE VENDO COMPANY, 4015 EAST RAINES ROAD, MEMPHIS, TENNESSEE 38118.
  - d. A like part will be shipped:
    - 1) At no charge if our inspection shows that the inoperative part became defective in warranty.
    - 2) And invoiced if the inoperative part does not meet the terms of the warranty.

Note: The returned part will be scrapped to eliminate any further handling charges.

2. If spare part is not available.
  - a. Order part using parts ordering procedure. The part will be shipped and invoiced to you.
  - b. After the part is received, follow the procedure outlined above in step 1.
    - 1) Be sure to check the box marked "credit" and to fill in the invoice number covering the part.
  - c. If our inspection shows that the inoperative part was defective in warranty, a credit will be issued to cancel the invoice on which the replacement part was shipped. This credit will include any prepaid transportation charges.
    - 1) To receive credit the inoperative part must be returned within 30 days from the date the replacement was shipped.
    - 2) Vendo does not issue cash credit for the return of any part or accessory.

## REFRIGERATION RETURN PROCEDURE

Refrigeration units require a separate refrigeration return tag (P/N L1322) for each unit returned. The procedure is the same as the material return, except the white (top) copy is attached to the unit and you keep the copy for your records. All refrigeration units are to be returned to: THE VENDO COMPANY, 4015 EAST RAINES ROAD, MEMPHIS, TENNESSEE 38118. The return tag must be filled out in its entirety. Refrigeration units should also be shipped via cheapest method of transportation (usually UPS ground).

## READING A PARTS LIST

1. ITEM NO. is found in two locations. One identifying the part on the drawing, Two identifying line on the parts list, the item number, is the identifying reference that ties together information on the parts list to pictorial representation of part on the drawing.
2. PART NO. is the Vendo part number for that specifically identified part.
3. NO. REQ. is the quantity of the part as it is used on this particular assembly page. An A/R means "as required" and is normally used when two different part no. columns are used and the quantity of the indicated part is different for each column.
4. PART NAME AND DESCRIPTION is the Vendo verbal description of that particular part.

FOR THE FOLLOWING STEPS - SEE EXAMPLE BELOW.

5. STEP 1 is the motor plate assembly. Anything indented under the part name of that part is a detail part of the assembly and will be included in the parts order when that assembly number is ordered.
6. STEP 2 is the motor hub assembly. This assembly is a sub-assembly of the motor plate assembly. The detail parts of this sub-assembly are indented under its part name. The detail parts of this sub-assembly will be included with that sub-assembly parts order and the entire sub-assembly will be included on any parts order of the motor plate assembly.
7. STEP 3 shows parts that are not part of the motor hub assembly, but which are part of the motor plate assembly.
8. STEP 4 shows individual parts that are not part of the motor plate assembly. These parts are not part of any normal assembly and must be ordered separately. NOTE: A screw in this position is normally used to attach above assembly to vender (in this example tapping screw V801431 attaches motor plate assembly to stack).
9. AN ASTERISK behind the part number, item number, and/or part name indicates a special note at the end of the parts list as it pertains to that part (or any part with that asterisk).
10. DN DRAWING. Circled number indicates a detail part. White number in black square indicates a reference part - either see another page or part not shown graphically.

	ITEM NO.	PART NO.	NO. REQ.	PART NAME AND DESCRIPTION

# Vendo®

## INITIAL SET UP

### 1. UNPACK

Remove all packing, cardboard and tape from exterior of vender. Remove all tape, shipping sealant and shipping styrofoam from interior of the vender. Also loosen any shipping devices used to secure interior parts during shipping (ex: backspace retainer).

Remove wooden shipping base (attached using the leveling screws). Re-install the leveling screws.

### 2. POSITION AND LEVEL VENDER.

**IMPORTANT:** Place the vender (in desired location) at least 3 - 4 inches away from any rear obstruction. This is for proper air flow through the refrigeration compartment. Air circulation, front to rear, is essential for proper operation of the refrigeration system.

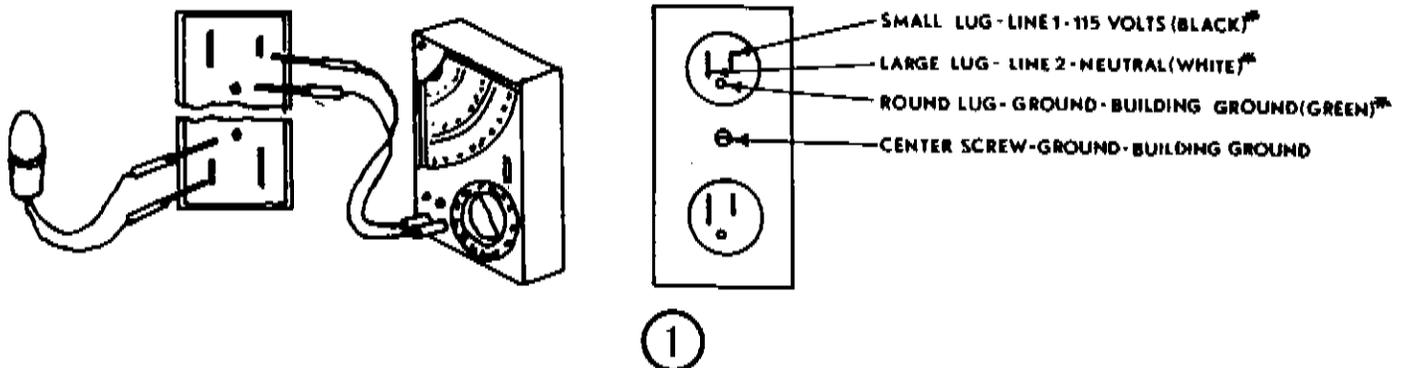

After positioning vender in desired and required position, adjust the leveling screws to properly level the vender. When the vender is properly leveled the door assembly can be opened to any position and will not move by itself.

### 3. CONNECT TO POWER SUPPLY (see FIGURE 1).

This vender requires a 115 volt AC 60 hertz power supply. Check power supply before connecting vender. Any power supply under 103 volts or over 126 volts may cause vender to malfunction.

#### **CAUTION: DO NOT USE AN EXTENSION CORD!**

To insure safe operation of an electrical device it must be properly grounded and the power supply polarization must match that of the electrical device. For the following test refer to FIGURE 1. With one probe of the test device, (test light or volt meter), connected to the center screw of power fixture and the other inserted into the large (neutral) orifice, you should get no reaction. When probe is inserted in small (power) orifice, you should get a reaction. (NOTE: If you get no reaction with either test the outlet is not properly grounded. If the reaction occurs between the center screw and large orifice the power source is not properly polarized.) If either of the above requirements are not met properly, you should contact a licensed electrician to obtain the correct power supply and grounding.

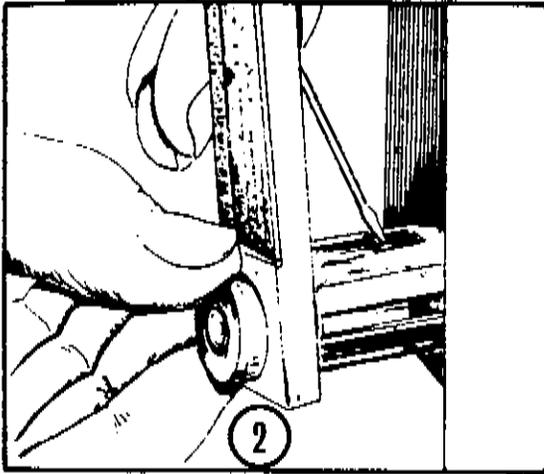

## 4. INSTALL COIN MECHANISM.

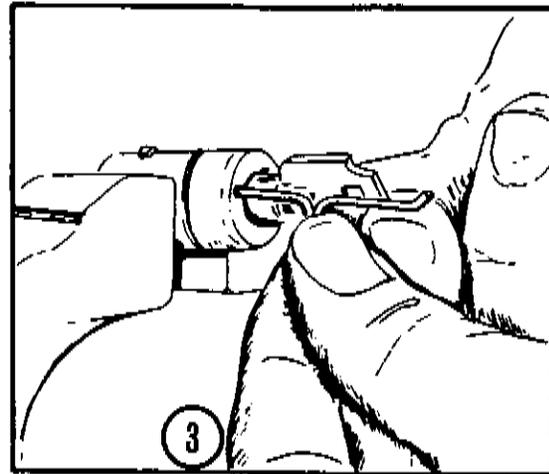

The coin mechanism mounts on the hinged coinage panel assembly. Remove the acceptor (where applicable) from the coin mech. Then slip the key holes in the back of the mechanism over the three mounting screws of coinage panel and tighten. Replace the acceptor (where applicable).

## 5. CODE YOUR LOCK (see FIGURES 2 thru 11).

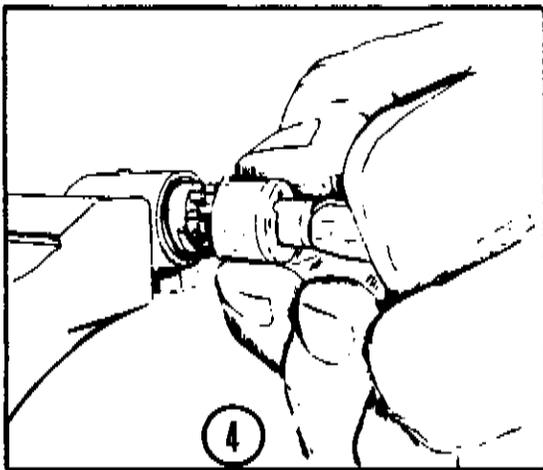

Locks may be recoded either remaining in the handle or outside the handle. Recoding is shown with lock removed from handle and is probably the easiest and safest way and will insure that the lock is recoded properly before it is replaced back into handle. NOTE: Fasten lock in vice or other means of securing lock.

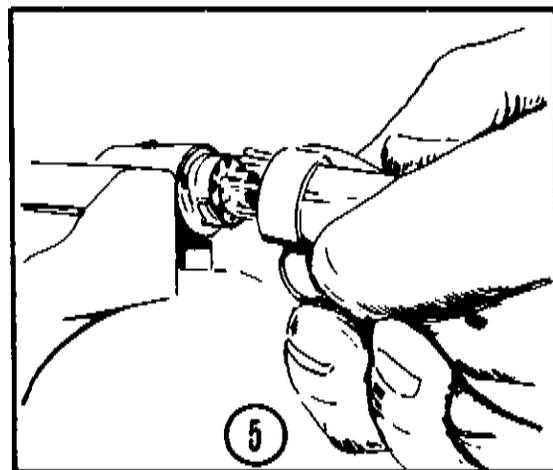

1. Lock may be removed by depressing the latch and sliding lock forward out of handle.

- Insert release pin into hole in cap. Push pin firmly and rotate key to release at the slot position.

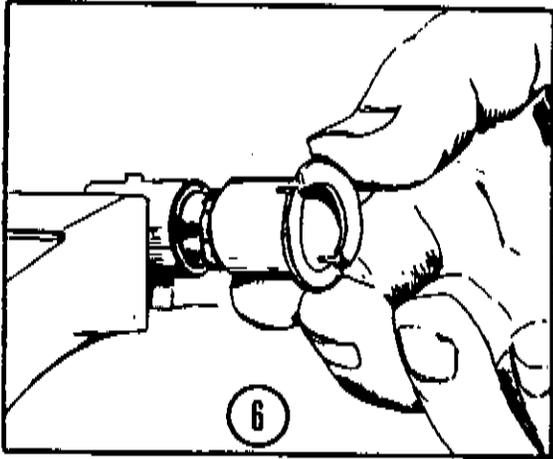

3. Remove cap with key as one unit.

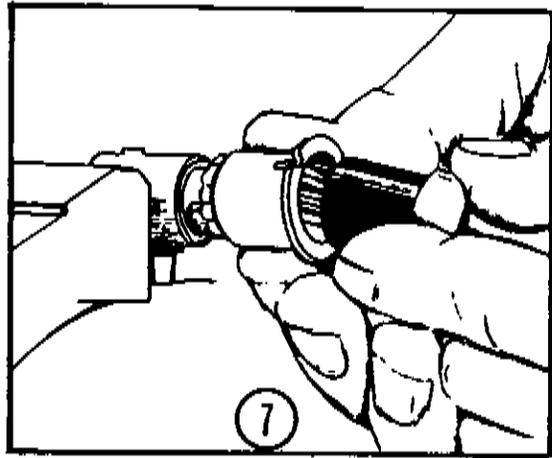

4. Using magnet end of loader tool, remove all seven (7) tumblers.

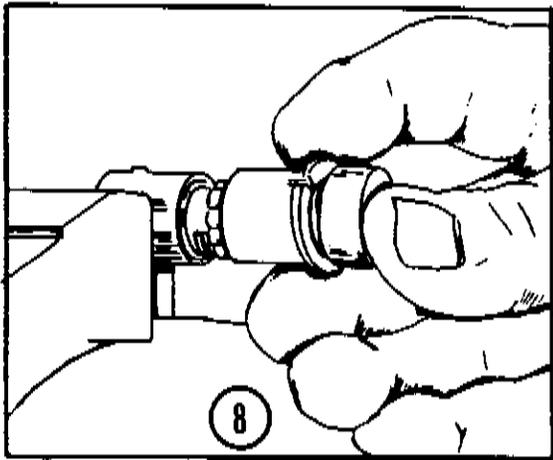

## CODE YOUR LOCK (Continued)

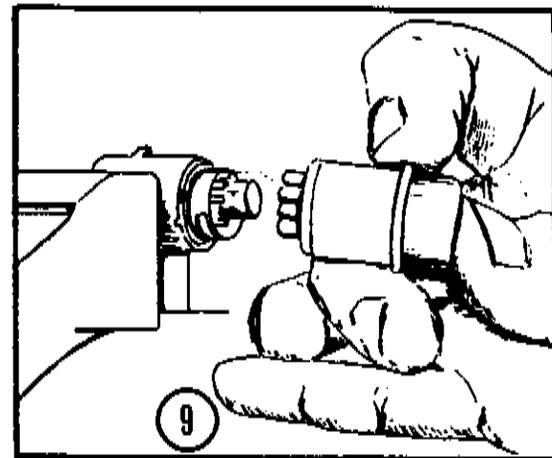

5. Place the preloaded coder into lock. It is slotted to go on the center shaft one way only.

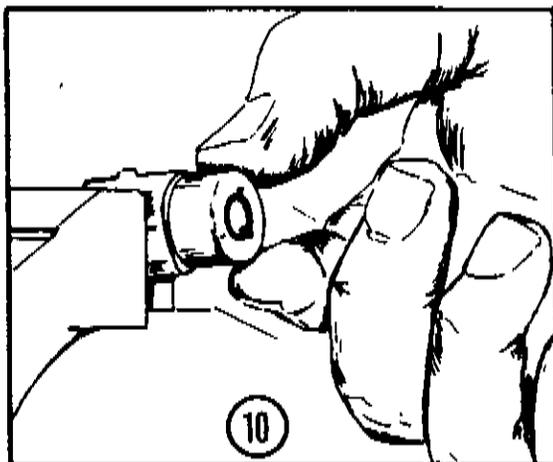

6. Place the loading tool into the coder. (It is slotted to fit one way only.)

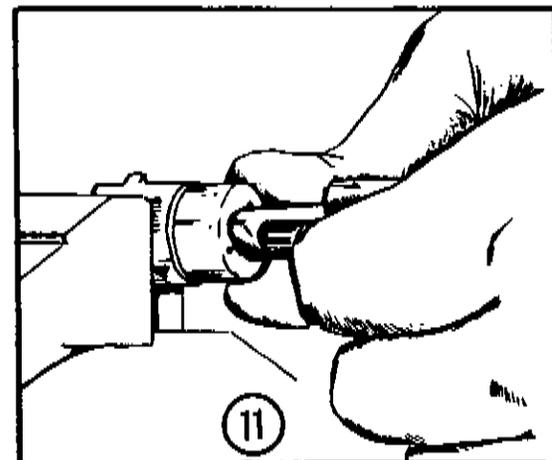

7. Press the new tumblers firmly into place.

8. While holding loading tool into coder, carefully remove both as one. Be certain all seven (7) tumblers are in place.

9. Replace the lock cap as removed.

10. Insert new key. Press cap in firmly and rotate key to locked position.

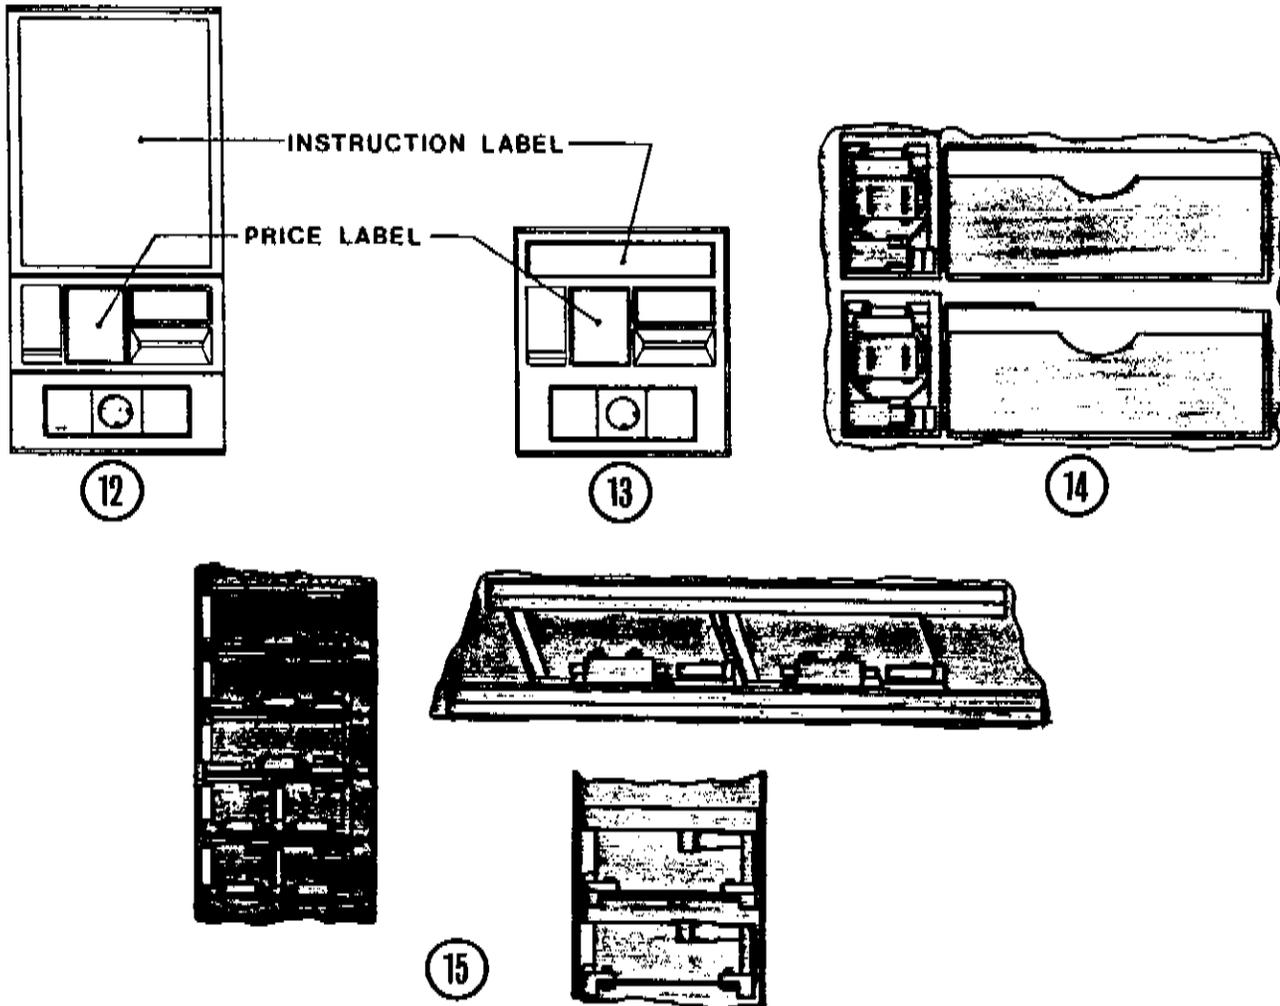

## 6. INSTALL INSTRUCTION, PRICE, & FLAVOR LABELS.

### a) COIN INSERT INSTRUCTION LABEL

- 1) For venders WITH coin insert casting w/validator opening. Be sure front surface of validator plug and coin insert casting are clean and dry. Peel off backing paper and apply with firm pressure in position shown in FIGURE 12.
- 2) For vender WITHOUT coin insert casting w/validator opening. Be sure front surface of coin insert casting is clean and dry. Peel off backing paper and apply with firm pressure in position shown in FIGURE 13.

### b) PRICE LABEL

Be sure coin insert castings is clean and dry. Peel off backing paper and apply with firm pressure in position shown in FIGURE 12 & 13.

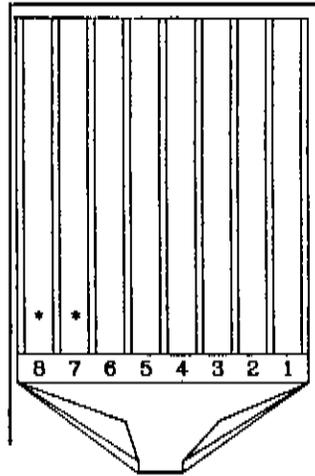

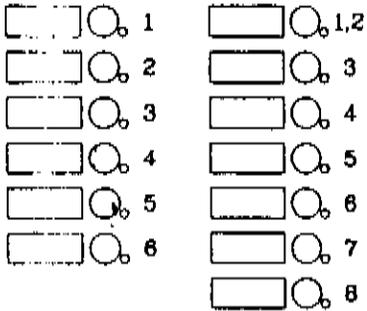

### c) FLAVOR LABEL(S)

- 1) For venders with rectangle selection windows. Open inner door, then open coinage mounting door. Insert labels into top of selection window. See FIGURE 14.
- 2) For venders with rectangular/square selection buttons. Open inner door, then open coinage mountings door. Insert labels into selection buttons from the left side of button as facing back of opened outer door. See FIGURE 15.
- 3) **NOTE:** Be sure that labels in selection buttons or windows properly identify product as related to stack columns. Refer to FIGURES 16, 17, 18, & 19 for selection button to column relationship. (Match your style and number of selection buttons to appropriate number of columns.)

7. CHECK DOOR SUPPORT (see FIGURE 20).

The door support may be raised or lowered, (by adding or removing shims), to insure that the outer door closes squarely to the cabinet. Raising or lowering door support can also help insure proper alignment of door latch.

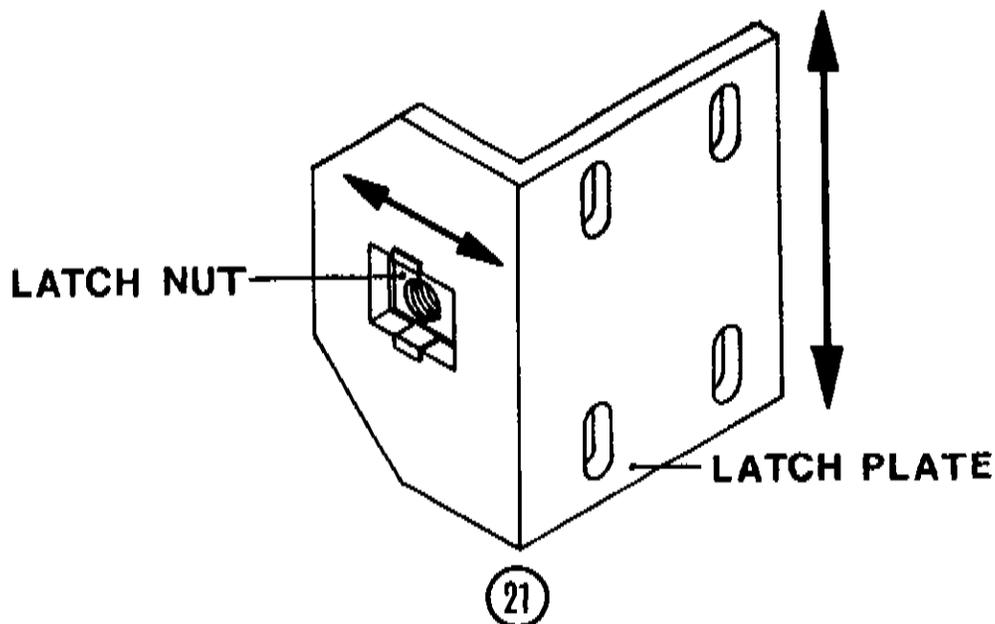

8. CHECK DELIVERY CHUTE ALIGNMENT.

The delivery chute may be raised or lowered to insure proper product delivery through the inner door eyelet to delivery hopper.

9. CHECK DOOR LATCH ALIGNMENT (see FIGURE 21).

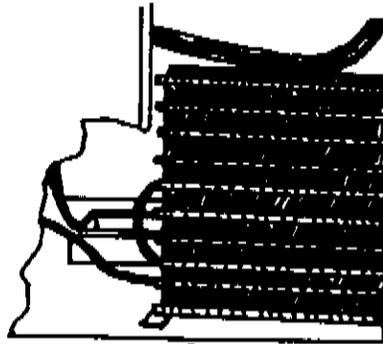

After any door adjustments - check door latch for proper alignment and engagement. The door latch is adjustable by moving latch bracket (on cabinet), up or down and by positioning latch nut, (in latch bracket), left or right in slot. (Further up and down adjustment may be obtained by adding or removing shims from under door support.)

10. CHECK REFRIGERATION AREA.

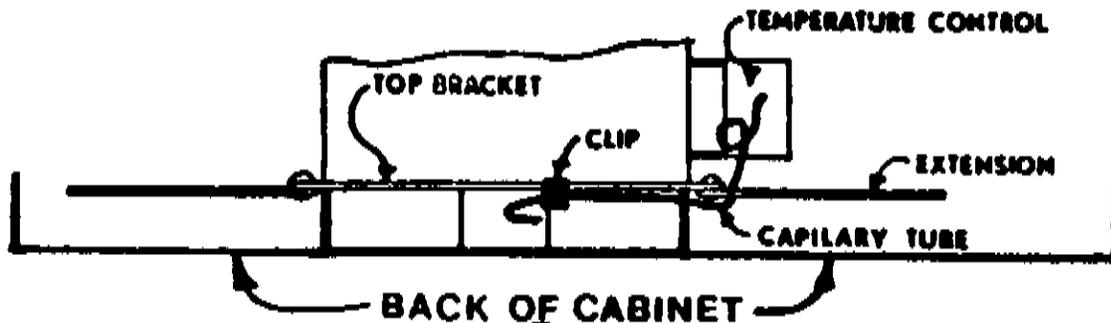

a) CONDENSATE PAN: Check to make certain that the condensate pan is in its proper position. Check the drain tubing leading to the pan seeing that it is secured with a clip and free of kinks. See FIGURE 22.

NOTE: Loop must be maintained in tubing for air "trap" purposes.

(22)

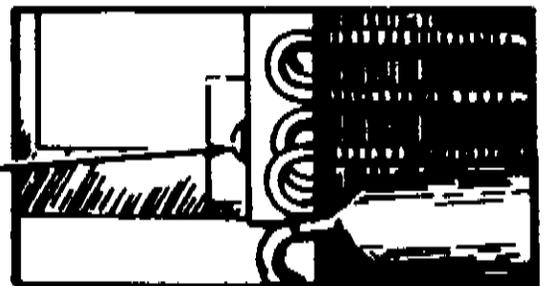

- b) **THERMOSTAT FEELER BULB POSITION:** in new production, as well as when replacing a refrigeration unit, it is possible to "distort" the position of the thermostat feeler tube. The feeler tube should be positioned as shown in FIGURE 23. It must not touch the rear cabinet wall or evaporator shield except at the retainer clip. The clip should be near the center of the evaporator.

(23)

- c) **TEMPERATURE CONTROL SETTING:** See FIGURE 24. The temperature inside the cabinet is regulated by the temperature control located on the left side of the evaporator. On some venders you will have to remove a metal cover over this area to get to the control. Before adjusting the control, make sure that all components of the refrigeration system are working properly and that the door seal is tight. The factory setting will normally be with "knob" at the center range. The Air Temperature at the feeler bulb should cut system in at 39 degrees fahrenheit. To increase the temperature turn the control counter clockwise. To decrease the temperature turn the control clockwise.  
 NOTE: For every 1/12 turn of control knob the temperature will change approximately two (2) degrees.
- d) Check to make sure that all fans run freely and are free of excessive noise and obstructions.
- e) Check compressor vanes to make sure that they are free of any obstructions. (Air flow over vanes is important to proper operation of refrigeration unit.)

TEMPERATURE CONTROL

(24)

COLD

## 11. CHECK FLUORESCENT LAMPS.

Check to make sure that all fluorescent lamps are properly and securely seated in their sockets.

**CAUTION:** FOR ALL SINGLE PIN ("SLIMLINE") FLUORESCENT LAMPS IT WILL BE NECESSARY TO REPLACE BURNT OUT LAMPS AS SOON AS POSSIBLE (24 - 48 HOURS), TO PREVENT BALLAST FROM ALSO BURNING OUT.

## 12. CHECK ADJUSTMENTS OF VEND SWITCHES (see FIGURE 25).

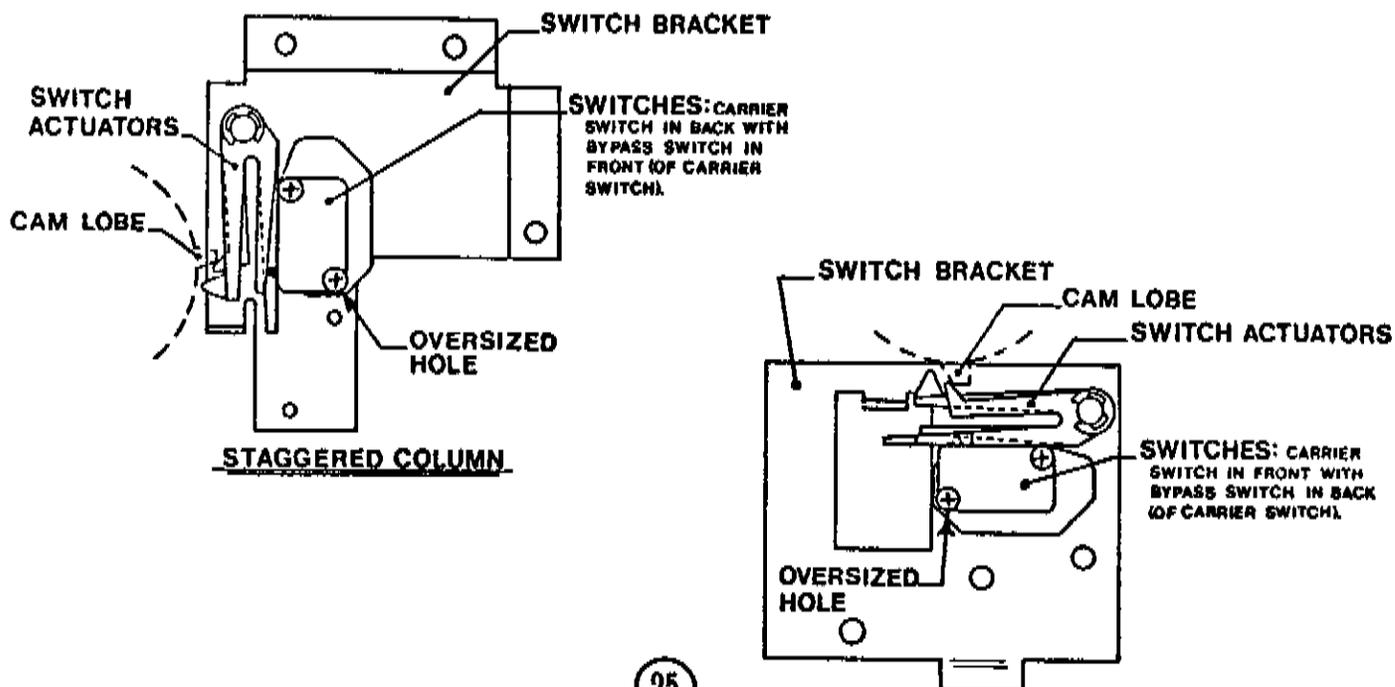

With cam lobe resting on the upper END surface of the motor carrier switch lever, adjust motor carrier and by-pass switches to insure proper switch actuation. (Screw mounting hole at the switch button end is oversized, the switches pivot on the opposite mounting screw.) The motor carrier switch is adjusted so that the switch button is fully depressed, but so that the switch lever does not touch the switch body. **NOTE:** This adjustment puts the motor carrier switch in its normally open (stand-by) position. The by-pass switch is adjusted (at the same time as motor carrier), so that its switch lever is touching (or resting against), the switch button, but NOT depressing the switch button. **NOTE:** This puts the by-pass switch in its normally closed (stand-by) position.

### HOW SWITCH ACTION SHOULD OCCUR

At stand-by: Cam lobe rest on upper end surface of motor carrier switch lever, motor carrier switch in normally open position and by-pass switch in normally closed position. When the motor starts, the cam lobe leaves the carrier switch lever, motor carrier switch goes to normally closed position. The lobe passes over the by-pass switch lever, momentarily actuating the by-pass switch (to its normally open position, then returning to normally closed). The motor continues to run until a cam lobe once again returns motor carrier switch to its normally open position (actuates switch). At this time both switches should be at their initially adjusted positions.

**NOTE:** When adjusting switches, it is recommended that you check switch adjustment for each lobe on cam. Then readjust switches to a "nominal" position to achieve proper switch actuation at each lobe position.

**NOTE:** For a detailed description of the switch action refer to the electrical operation section of this manual.

25

SINGLE COLUMN

13. If your vender is equipped with an Electronic Selection Board, be sure it is plugged in.

## LOADING INSTRUCTIONS

### I SINGLE DEPTH

#### A. Staggered (Wide) Column

1. Move backspacer to maximum rear position.

2. Install shims and/or form spacers. (See FIGURE 26).

a) Installation of shim and/or form spacers are based on average diameter of products. See chart below.

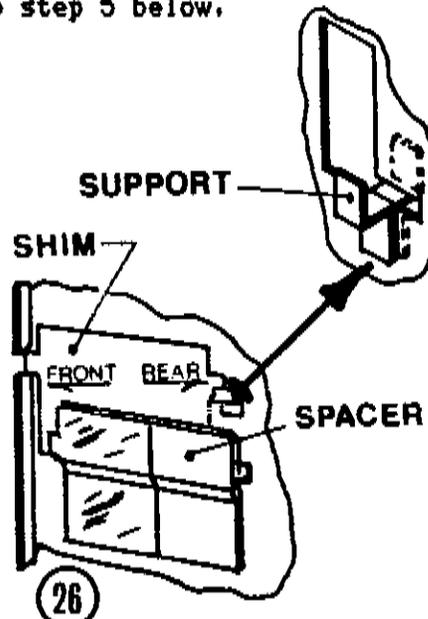

Large Diameter Product: (Example: 16 oz. Polylabeled Bottle*)	DO NOT INSTALL
Medium Diameter Product: (Example: 12 oz. Returnable Bottle)	No form spacer 0 - 2 shims
Small Diameter Product: (Example: 10 oz. Returnable Bottle)	One form spacer 1 - 3 shims
<b>NOTE:</b> Number of shims and/or form spacers are <u>per side of column</u> .	

\*Note: Requires usage of short sold out lever, stack brace, and 16 oz. bail bracket.

b) Install spacer supports, one on each side of column (insert support in hole in rear of column, then slide back into slot).

c) Hang shim and/or form spacers on support and in hole in front of stack. Spacers are designed for right and left sides of column. Stainless steel covered portion will go towards front and center of column.

d) To determine proper spacing of product after shims and/or form spacers are installed, refer to step 5 below.

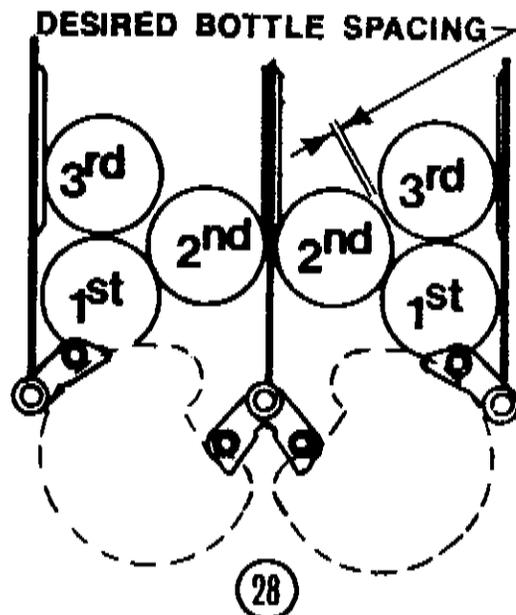

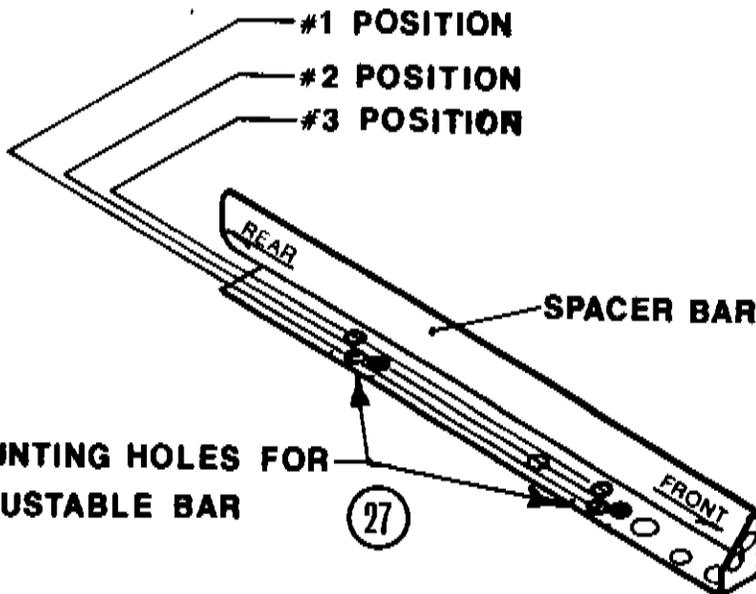

3. Position adjustable rail on spacer bar. See FIGURE 27.

- a) There is an adjustable rail on the spacer bar at the bottom of the partition on each side of the column. The chart below describes the "nominal" position of these rails as related to the average diameter of the products to be vended.

Small Diameter Product: (Example: 10 oz. Returnable Bottle)	in #2 Position
Medium Diameter Product: (Example: 12 oz. Returnable Bottle)	in #3 Position
Large Diameter Product: (Example: 16 oz. Polylabeled Bottle*)	DO NOT INSTALL

**NOTE:** These are "Nominal" positions only. The adjustable rail should be positioned to provide at least 1/8" clearance as the product passes through the spacer bar and the bail (vend space).

\*NOTE: Requires usage of short sold out lever, stack brace, and 16 oz. bail bracket.

- Load first three (3) products. (See FIGURE 28)
  - Load first product on the lowering shelf which is in the UP position. Load as far forward as possible with the crown towards rear of column.
  - Load second product on opposite side of column and third product above the first.
- Check each column for proper use of shims and form spacers.
  - Make check with only three (3) products in column.
  - Check the spacing between the largest parts (probably butts) of products #2 and #3 for a desired spacing of 1/8" (See FIGURE 28).
- Check position of backspacer for approximately 1/2" spacing between product crown and backspacer. Adjust if necessary.
- Continue to load column in staggered manner until at least 12 products have been loaded.
- Test vend column until at least two (2) products vend.
- Complete loading of column in staggered manner.

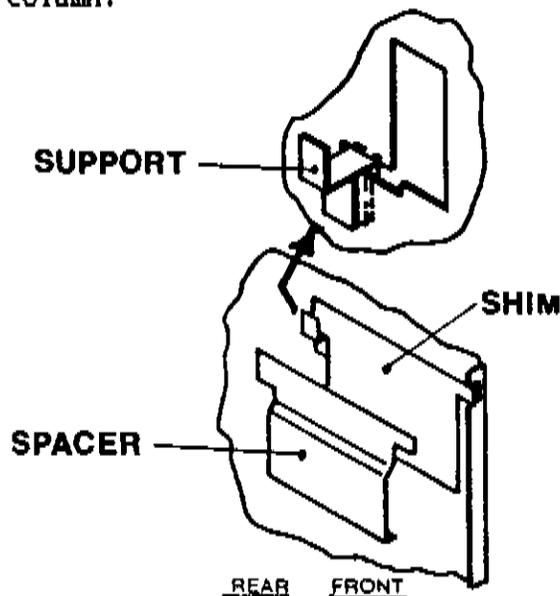

## B. Single (Narrow) Column

1. Move backspacer to maximum rear position.
2. Install shims and/or form spacer on right side of column. (see FIGURE 29)
  - a) Installation of shims and/or form spacers are based on average diameter of products. See chart below.

Large Diameter Product: (Example: 16 oz. Polylabeled Bottle*)	No Form Spacer 0 - 2 shims
Medium Diameter Product: (Example: 12 oz. Returnable Bottles)	3/8" Form Spacer 0 - 2 shims
Small Diameter Product: (Example 10 oz. Returnable Bottle)	3/8" Form Spacer 1 - 3 shims

\*NOTE: Requires usage of short sold out lever.

- b) Install spacer support in right rear side of column (insert support into hole, then slide back into slot).
  - c) Hang shims and/or form spacer with wide tab on spacer support and narrow tab in hole in front of stack.
3. Load product on blocking shelf as far forward as possible with crown towards rear of column.
4. Check backspacer for approximately 1/2" spacing between product crown and backspacer. Adjust if necessary.
5. Load at least six (6) products on top of first product.
6. Test vend column until at least two (2) products vend.
7. Complete loading of column.

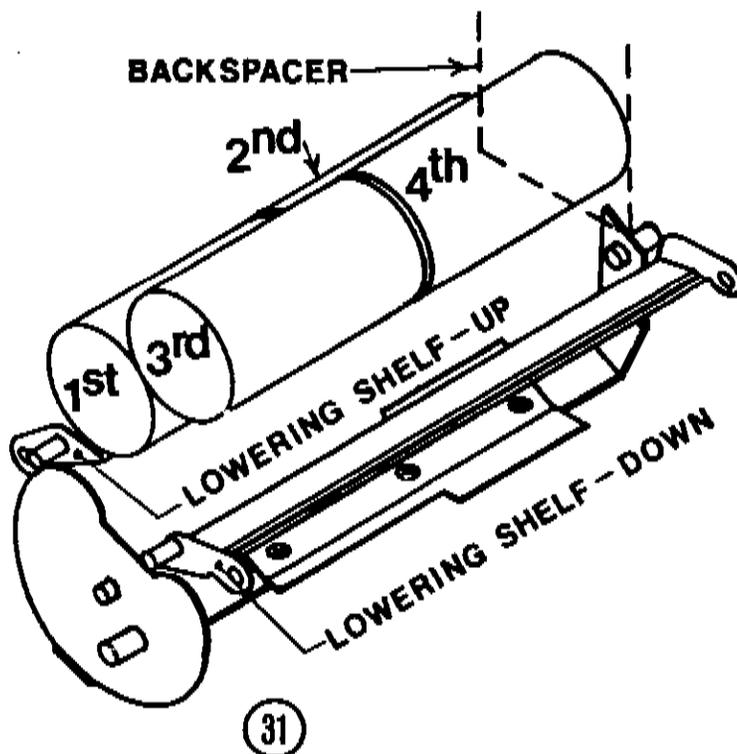

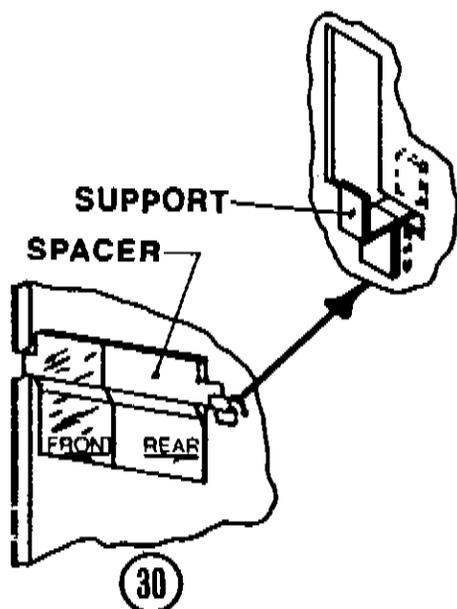

29

## II DOUBLE DEPTH

### A. Staggered (Wide) Column

NOTE: For 10 OZ. Cans: install two (2) stainless steel covered form spacers (one on each side of column). See FIGURE 30.  
For all others: Use no shims or form spacers.

1. Move backspacer to maximum rear position.  
NOTE: For 10 oz. poly-labeled bottles with plastic caps: rotate backspacer 180 degrees, then move to maximum rear position.
2. First two (2) products must be loaded on the lowering shelf which is in the "up" position. Place first product on the shelf as far forward as possible. Then load second product on the same shelf directly behind the first product. See FIGURE 31. NOTE: There must not be any product on the bail at this time during initial loading.
3. Check backspacer for approximately 1/2" spacing between second product and backspacer. Adjust if necessary.
4. Load next two (2) products on opposite side of column in the same manner as described in Step 2 above. (See FIGURE 31.)
5. Continue to load column in staggered manner until at least 12 products have been loaded.
6. Test vend column until at least four (4) products vend.
7. Complete loading of column in staggered pattern.  
CAUTION: It is very important that care is taken when loading poly-labeled bottles. The bottle is not "flat sided" and will tend to crown down. If the front column crowns slide into the rear column while loading, jams may occur when interlocking columns reach the vend mech.

## B. Single (Narrow) Column

1. Move backspacer to maximum rear position.

2. Install shims and/or form spacer on right side of column. See FIGURE 32.

a) Installation of shims and/or form spacers are based on average diameter of products. See chart below.

Large Diameter Product: (Example: 10 oz. Poly-labeled Bottle)	1/4" Form Spacer 0 - 1 shims
Medium Diameter Product: (Example: 12 oz. can)	1/4" Form Spacer 1 - 2 shims
Small Diameter Product: (Example: 10 oz. can)	3/8" Form Spacer 1 - 3 shims

b) Install spacer support in right rear side of column (insert support into hole then slide back into slot).

c) Hang shims and/or form spacer with wide tab on support and narrow tab in hole in front of stack.

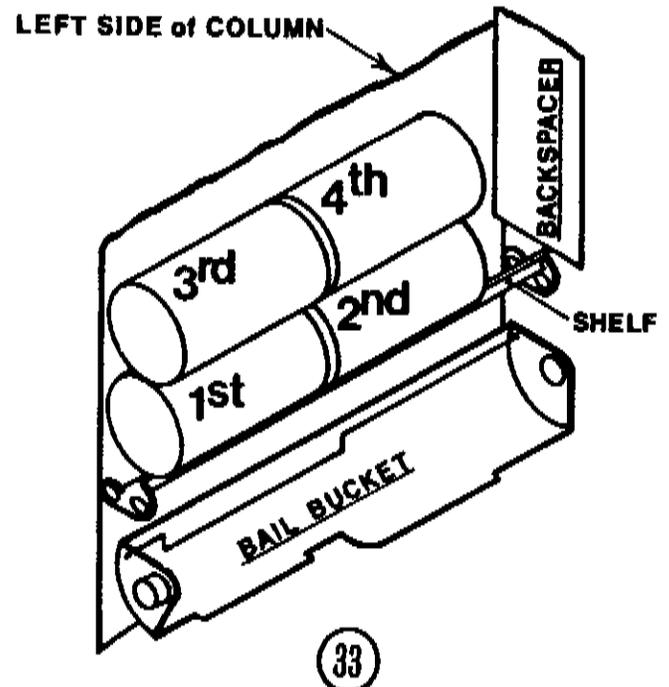

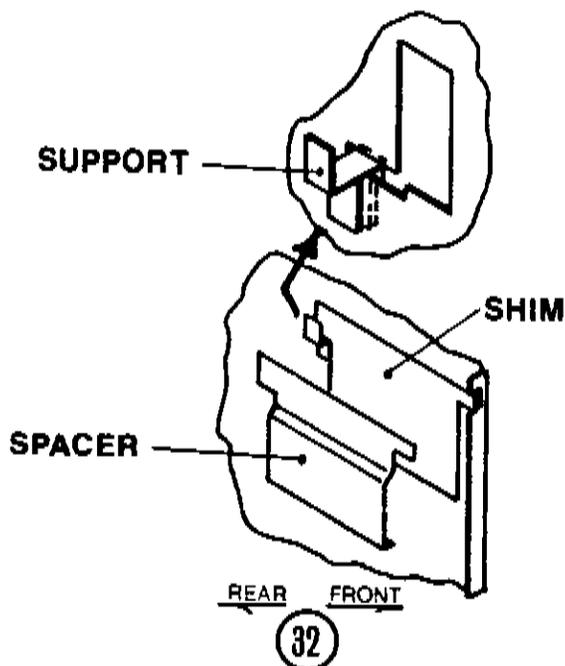

3. Load two (2) products on the blocking shelf. Place first product on the shelf as far as possible. Then load second product on the shelf directly behind the first product. (See FIGURE 33)

4. Check backspacer for approximately 1/2" spacing between second product and backspacer. Adjust if necessary.

5. Load at least ten (10) products on top of first two (2) products in the same manner as in Step 3 above.

6. Test vend column until at least for (4) products vend.

7. Complete loading of column.

## CONVERSION INSTRUCTIONS

These conversion instructions will give basic conversion principles on how to convert from one product size to another. These instructions will be based on converting one column and will assume that all parts necessary are on hand. Kits are available to convert to various products, please refer to kit list in this manual (Page A5). Each kit will normally contain enough parts to convert entire machine to desired product.

These instructions are written in four basic categories, (I) Vender/Column preparation, (II) Typical (individual parts) conversion procedures, (III) Specific Product conversion procedures, (from one product to other products), (IV) Part - to Product usage guide.

### I. PREPARATION STEPS

When converting vender from one product size to another the following "preparation steps" are necessary.

- A. Remove vend mech cover.
- B. Remove all product from the column(s) to be converted.
- C. Stop motor so that cam mounting screws are visible and not blocked by the drive link. Also, 1) For staggered (wide) column(s): the bail should be positioned directly at the bottom of the column to allow access to the bail bracket mounting screws; 2) for single (narrow) column(s): the bail bucket should be positioned in the column so as to allow access to the inside curve of bucket.

These conditions can be accomplished by:

- 1) Starting motor by operating the motor carrier switch (via lever).
- 2) Stopping motor in the desired position by removing one of the motor wires.

- D. CAUTION: REMOVE POWER FROM THE VENDER AND THE PROCEED AS REQUIRED.

### II. TYPICAL PROCEDURES

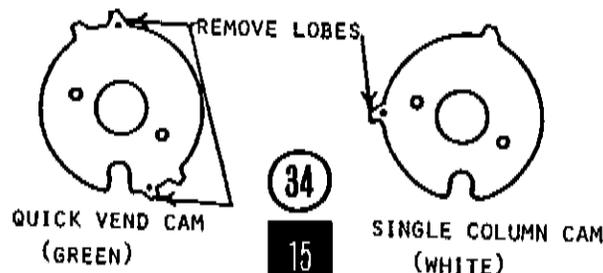

During the conversion process it will be necessary to re-position or install various parts. Although the parts may be different sizes used in different positions, their installation and/or re-positioning procedures will be similar.

The following is a description of the various procedures by part name. To determine what parts are used where refer to Section III of conversion instructions. (Addition parts usage may be found on the parts to product usage guide chart on page 75.)

**NOTE:** \* - Indicates parts are installed in staggered (wide) columns only.  
\*\* - indicates parts are installed in single (narrow) columns only.

#### A. MOTOR CAM (See FIGURE 34).

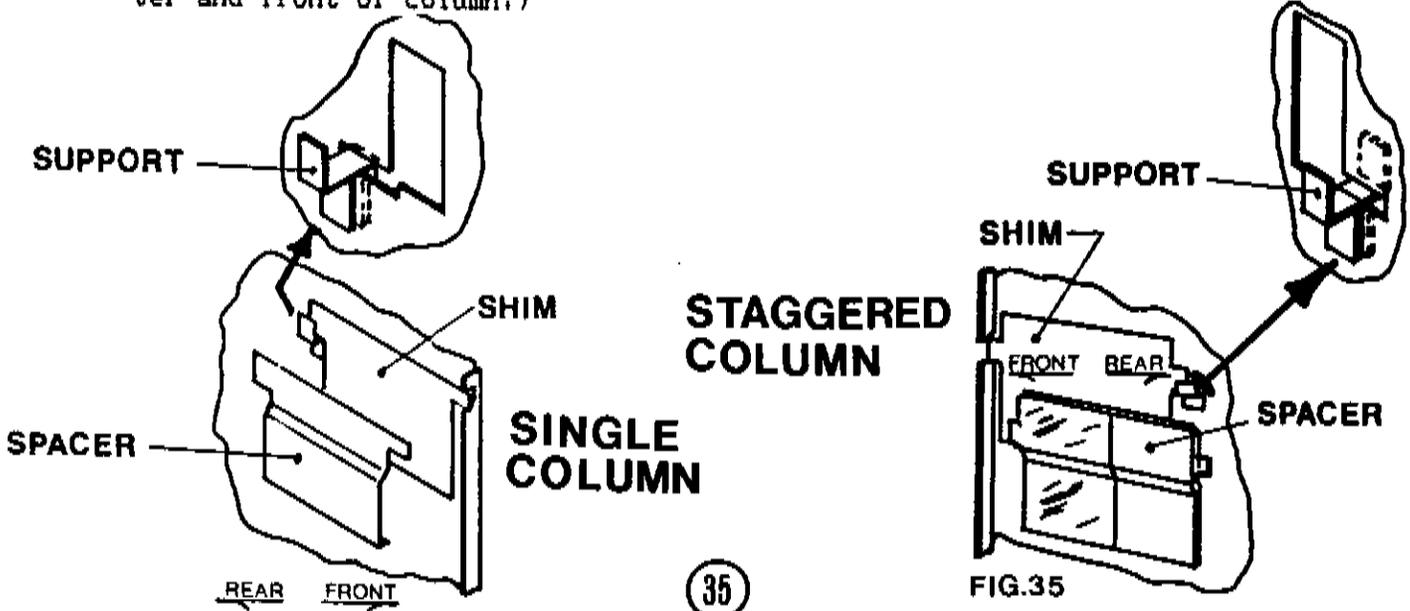

1. For double depth to single depth.
  - a) Remove cam from motor (save the two (2) screws)
  - b) Carefully break off the lobe(s) marked by a hole and scribe mark (refer to FIGURE 34).
  - c) Re-install cam on motor (use the two existing screws).
2. For single depth to double depth.
  - a) Replace modified (single depth) cam from motor (save the two (2) screws).
  - b) Re-install new (double depth) cam on motor (using the two (2) existing screws).

## B. FORM SPACER AND SHIMS (See FIGURE 35).

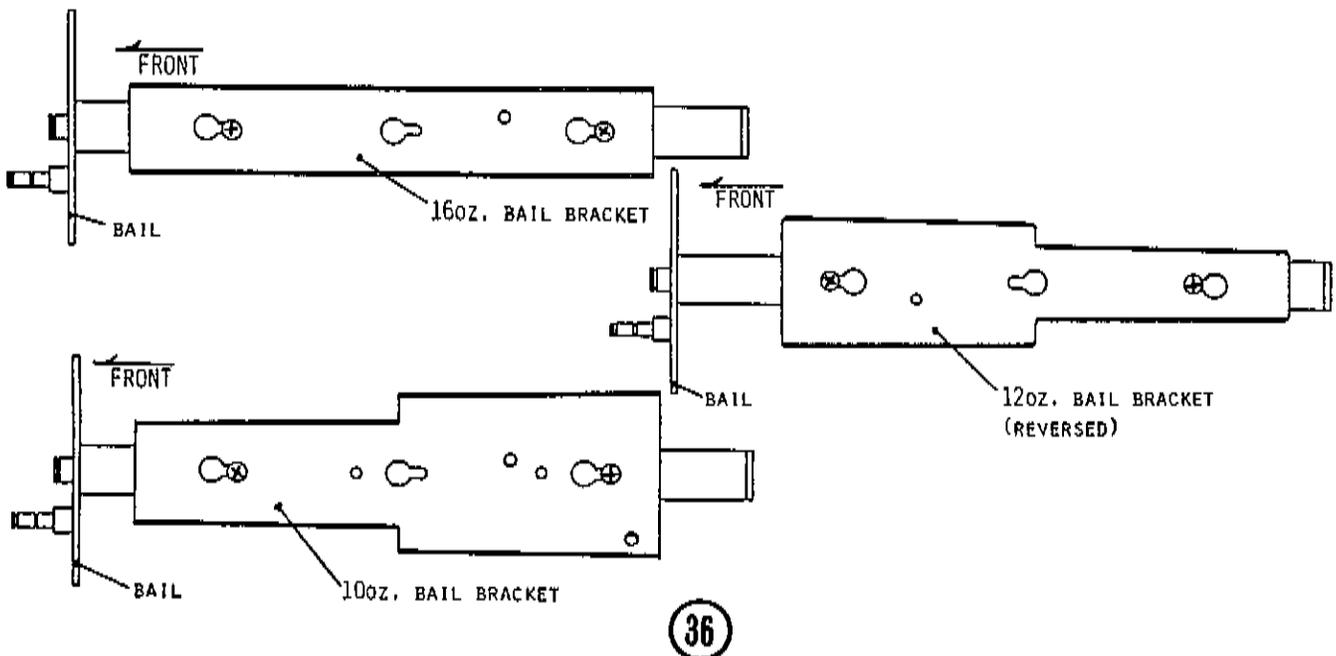

**NOTE:** For staggered (wide) columns form spacer and/or shim(s) are installed on each side of column. For single (narrow) columns form spacer and/or shim(s) are installed on right side of column only.

1. Install spacer support by inserting support into hole at rear of column partition. Then slide support back into slot.
  2. Hang form spacer and/or shim(s) on support and in hole in front of stack.
- NOTE:** Staggered (wide) column form spacers are designed for right and left sides of column. (install with stainless steel covered portion towards center and front of column.)

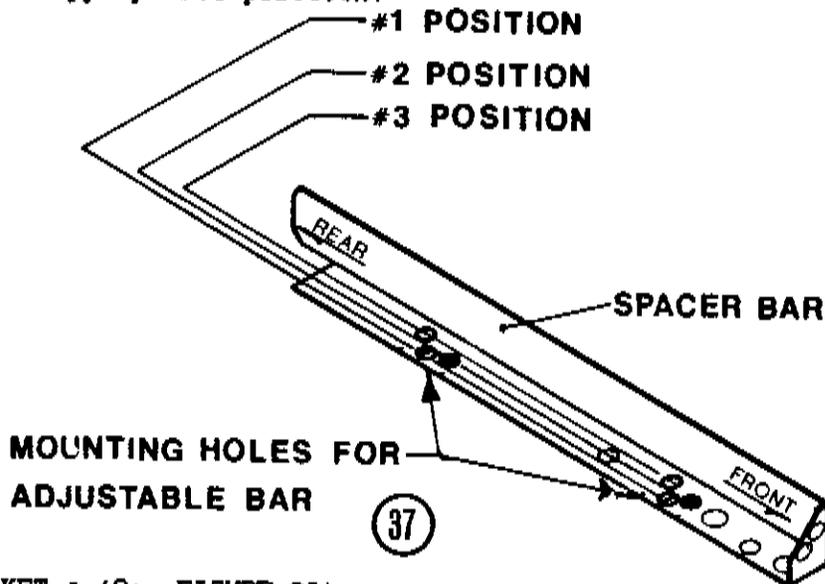

## C. BAIL BRACKET \* (See FIGURE 36)

1. Install two (2) tapping screws in bail so that the heads of the screws are on the top surface of bail bar. Do not fully install screws.
2. Install bail bracket by positioning large holes over screws, then sliding forward (or backward) so that screws slide into key slots.
3. Tighten down tapping screws, securing bail bracket to bail.

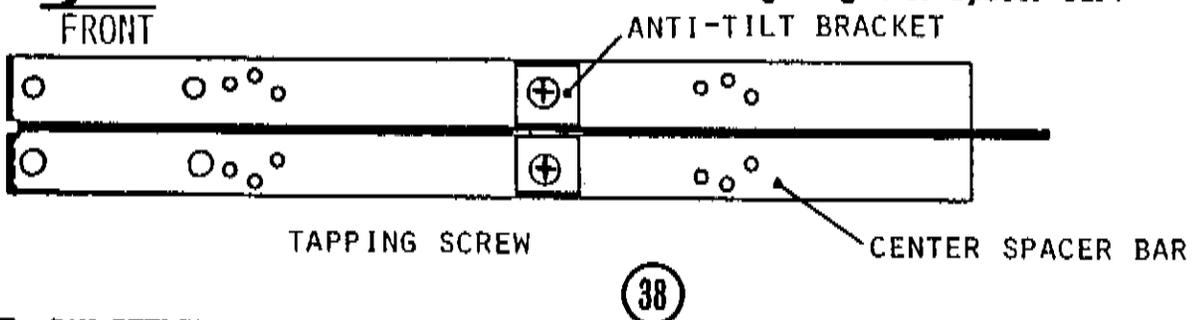

**D. ADJUST RAIL \* (See FIGURE 37).**

Install adjustable rail on spacer bar (at bottom of partition) with straight edge towards center of column. Use two (2) tapping screws to secure (Note: Tapping screws tap into spacer bar). Install one rail per side of staggered (wide) column in appropriate position.

**E. ANTI-TILT BRACKET \* (See FIGURE 38)**

Install anti-tilt bracket on spacer bar (at bottom of partition) with long leg of bracket facing up and towards center of column. Use a tapping screw to secure (Note: Tapping screw taps into spacer bar). Install one bracket per side of staggered (wide) column centered along length of spacer bar.

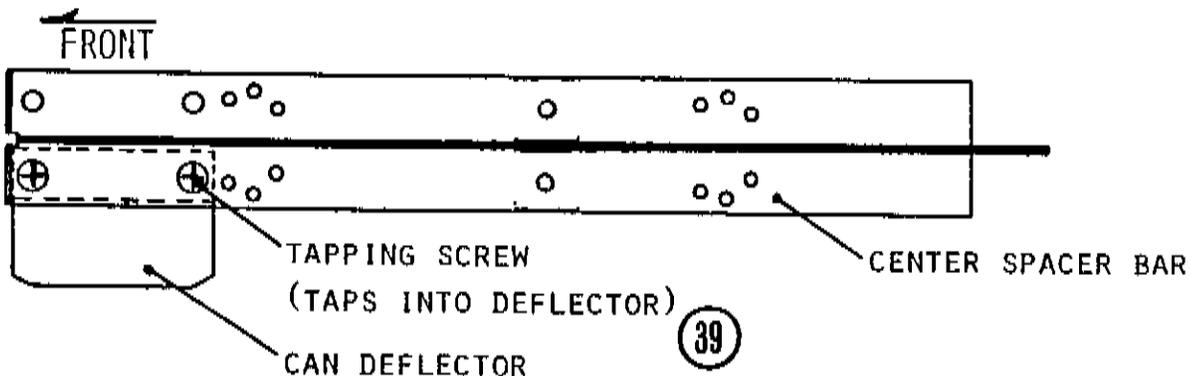

**F. CAN DEFLECTOR \* (See FIGURE 39)**

Install can deflector to spacer bar (at bottom of partition) with long leg of deflector facing down and towards center of column. Use two (2) tapping screws to attach (Note: Screws tap into deflector through spacer bar). Install one deflector per staggered (wide) column towards front of column.

NOTE: For 4 + 2 machines: 1 on left side column 4, 1 on right side column 3, 1 on right side column 2.

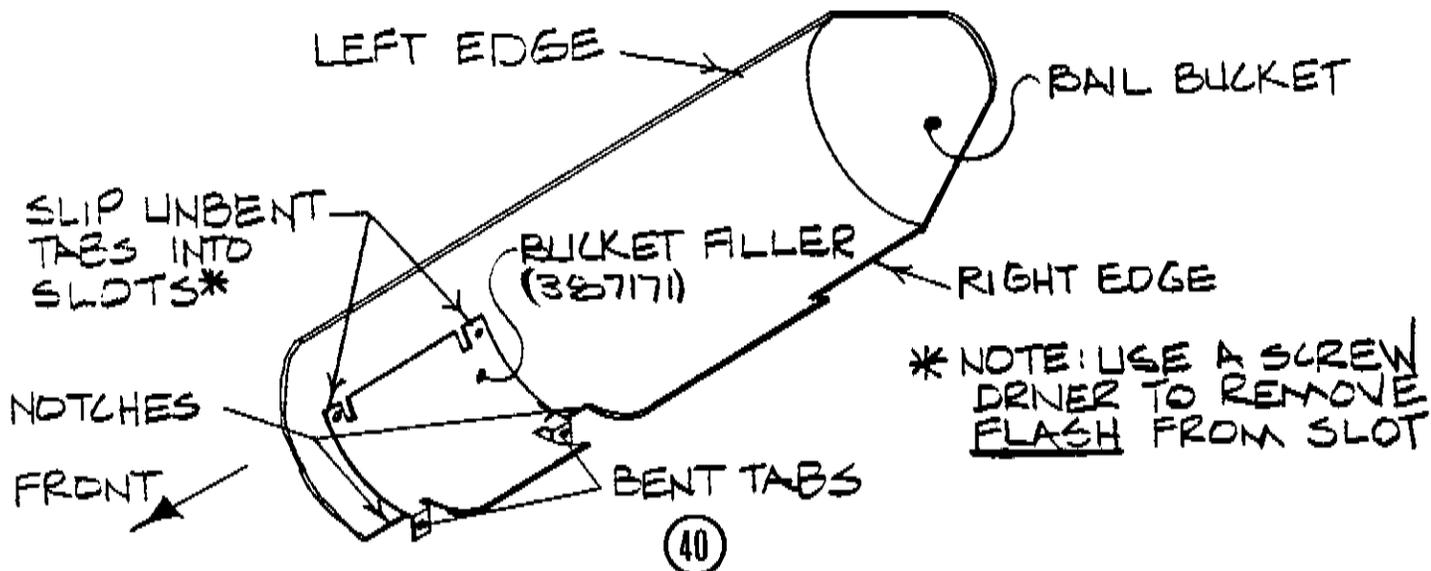

For 5 + 3 machines: 1 on left side column 5, 1 on right side column 4, 1 on right side column 3.

## G. BUCKET FILLER \*\* (See FIGURE 40)

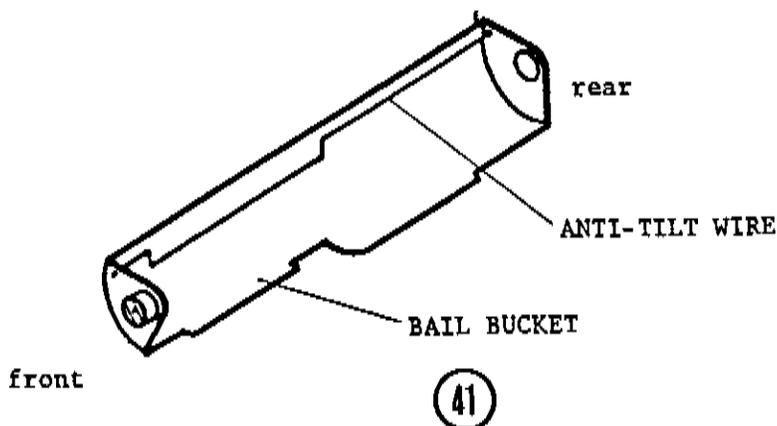

1. Knock out flashing from slots in bail bucket.
2. Slip unbent tabs of filler into slots.
3. Slip bent (@ 90 degrees) tabs of filler over notches on the right edge of bucket.
4. Secure filler to bucket by bending all four tabs.

**CAUTION:** Bucket filler must be tight into inside curve of bucket.

## H. ANTI-TILT WIRE \*\* (See FIGURE 41)

Install anti-tilt wire in bail bucket by slipping each end of wire into hole in each end of bucket so that short square fold is towards front of column.

## III. SPECIFIC PRODUCT CONVERSION PROCEDURES

NOTE: Refer to Typical Procedures ( page 15 thru 18 ) for detailed information on how to perform the various functions described in to the following product procedures.

NOTE: Refer to kit list (page A5) and to parts-to-product guide (page 75) for a listing of various product kits. Each kit will normally contain all the parts necessary to convert entire machine to that product. Those kits that only convert one column are so indicated on respective list. Also each kit will contain detailed instructions on how to convert machines (or column) to that particular product.

NOTE: Refer to loading instructions for proper loading and adjustments of different product sizes.

### A. FROM 10 OZ. CAN

#### 1. to 12 oz. Can

##### Staggered Column

- a. Remove 10 oz. bail bracket, can deflector, and form spacers.
- b. Install 12 oz. bail bracket with wide flange towards rear of column.

##### Single Column

- a. Remove 3/8" form spacer and shims.
- b. Install 1/4" form spacer and 2 shims.

#### 2. to 10 oz. Poly-labeled Bottle

##### Staggered Column

- a. Remove 10 oz. bail bracket, can deflector and form spacers.
- b. Install 12 oz. bail bracket with wide flange towards rear of column.

##### Single Column

- a. Remove 3/8" form spacer and shims.
- b. Install 1/4" form spacer.

#### 3. to 16 oz. Poly-labeled Bottle

##### Staggered Column

- a. Remove 10 oz. bail bracket, can deflector, form spacers, and anti-tilt brackets.
- b. Install 16 oz. bail bracket.
- c. Replace sold-out lever with sold-out lever.
- d. Install stack brace.
- e. Modify cam to single depth.

##### Single Column

- a. Remove 3/8" form spacer, shims and anti-tilt wire.
- b. Install bucket filler.
- c. Replace sold-out lever with short sold-out lever.
- d. Modify cam to single depth.

#### 4. to 10 oz. Returnable Bottle

##### Staggered Column

- a. Remove 10 oz. bail bracket, can deflector and anti-tilt brackets.
- b. Install 12 oz. bail bracket with wide flange towards front of column.
- c. Install 3 shims per side of column.
- d. Install adjustable rail in the # 2, 1 per side of column.
- e. Modify cam to single depth.

##### Single Column

- a. Remove anti-tilt wire.
- b. Install bucket filler.
- c. Replace flat backspacer with channeled backspacer.
- d. Modify cam to single depth.

#### 5. to 16 oz. Returnable Bottle

##### Staggered Column

- a. Remove 10 oz. Bail Bracket, can deflector, form spacers, and anti-tilt wire.
- b. Install 12 oz. bail bracket with wide flange towards front of column.
- c. Modify cam to single depth.

##### Single Column

- a. Remove 3/8" form spacer, shims and anti-tilt wire.
- b. Install 1/4" form spacer and 2 shims.
- c. Install bucket filler.
- d. Replace flat backspacer with channeled backspacer.
- e. Modify cam to single depth.

## B. FROM 12 OZ. CAN

### 1. to 10 oz. Can

#### Staggered Column

- a. Remove 12 oz. Bail Bucket.
- b. Install 10 oz. bail bracket with wide flange to rear of column.
- c. Install form spacers - 1 per side of column.
- d. Install can deflector (See page 17 for column used).

#### Single Column

- a. Remove 1/4" form spacer and shims.
- b. Install 3/8" form spacer and 3 shims.

### 2. to 10 oz. Polylabeled Bottle

#### Staggered Column

- a. No changes required.

#### Single Column

- a. Remove shims.

### 3. to 16 oz. Polylabeled Bottle

#### Staggered Column

- a. Remove 12 oz. bail bracket, and anti-tilt brackets.
- b. Install 16 oz. bail bracket.
- c. Replace sold out lever with short sold out lever.
- d. Install stack brace.
- e. Modify cam to single depth.

#### Single Column

- a. Remove 3/8" form spacer, shims and anti-tilt wire.
- b. Install bucket filler.
- c. Replace sold out lever with short sold out lever.
- d. Modify cam to single depth.

### 4. to 10 oz. Returnable Bottle

#### Staggered Column

- a. Remove anti-tilt Brackets.
- b. Remove 12 oz. bail bracket and re-install with wide flange to front of column.
- c. Install adjustable rail in the # 2 position, 1 per side of column.
- d. Install 1 form spacer with 3 shims per side of column.
- e. Modify cam to single depth.

#### Single Column

- a. Remove 1/4" form spacer, shims, and anti-tilt wire.
- b. Install bucket filler.
- c. Install 3/8" form spacer and 3 shims.
- d. Replace flat backspacer with channeled backspacer.
- e. Modify cam to single depth.

### 5. to 16 oz. Returnable Bottle

#### Staggered Column

- a. Remove anti-tilt brackets.
- b. Remove 12 oz. bail bracket and re-install with wide flange to front of column.
- c. Modify cam to single depth.

#### Single Column

- a. Remove anti-tilt wire.
- b. Install bucket filler.
- c. Replace flat backspacer with channeled backspacer.
- d. Modify cam to single depth.

## C. FROM 10 OZ. POLYLABELED BOTTLE

### 1. to 10 oz. Can

#### Staggered Column

- a. Remove 12 oz. bail bracket.
- b. Install 10 oz. bail bracket with wide flange to front of column.
- c. Install form spacer - 1 per side of column.
- d. Install can deflector (see page 17 for columns used).

#### Single Column

- a. remove 1/4" form spacer.
- b. Install 3/8" form spacer and 3 shims.

### 2. to 12 oz. Can

#### Staggered Column

- a. No changes required.

#### Single Column

- a. Install 2 shims.

### 3. to 10 oz. Polylabelled Bottle

#### Staggered Column

- a. Remove 12 oz. bail bracket, and anti-tilt brackets.
- b. Install 16 oz. bail bracket.
- c. Replace sold-out lever with short sold-out lever.
- d. Install stack brace.
- e. Modify cam to single depth.

#### Single Column

- a. Remove 1/4" form spacer and anti-tilt wire.
- b. Install bucket filler.
- c. Replace sold-out lever with short sold-out lever.
- d. Modify cam to single depth.

### 4. to 10 oz. Returnable Bottle

#### Staggered Column

- a. Remove anti-tilt bracket.
- b. Remove 12 oz. bail bracket and re-install with wide flange to front of column.
- c. Install adjustable rail in the # 2 position, 1 per side of column.
- d. Install 1 form spacer and 3 shims per side of column.
- e. Modify cam to single depth.

#### Single Column

- a. Remove 1/4" form spacer and ant-tilt wire.
- b. Install bucket filler.
- c. Install 3/8" form spacer and 3 shims.
- d. Replace flat backspacer with channeled backspacer.
- e. Modify cam to single depth.

### 5. to 16 oz. Returnable Bottle

#### Staggered Column

- a. Remove anti-tilt bracket.
- b. Remove 12 oz. bail bracket and re-install with wide flange to front of column.
- c. Modify cam to single depth.

#### Single Column

- a. Remove anti-tilt wire.
- b. Install 2 shims.
- c. Install bucket filler.
- d. Replace flat backspacer with channeled backspacer.
- e. Modify cam to single depth.

## D. FROM 16 OZ. POLYLABELLED BOTTLE

### 1. to 10 oz. Can

#### Staggered Column

- a. Remove 16 oz. bail bracket and stack brace.
- b. Install 10 oz. bail bracket with wide flange to rear of column.
- c. Install 1 form spacer per side of column.
- d. Install anti-tilt bracket, 1 per side of column.
- e. Install can deflector (see page 17 for columns used).
- f. Replace short sold-out lever with standard sold-out lever.
- g. Replace modified cam with new cam (double depth).

#### Single Column

- a. Remove Bucket filler.
- b. Install 3/8" form spacer and 3 shims.
- c. Install anti-tilt wire.
- d. Replace short sold-out lever with standard sold-out lever.
- e. Replace modified cam with new cam (double depth).

### 2. to 12 oz. Can

#### Staggered Column

- a. Remove 16 oz. bail bracket and stack brace.
- b. Install 12 oz. bail bracket with wide flange to rear of column.
- c. Install anti-tilt bracket, 1 per side of column.
- d. Replace short sold-out lever with standard sold-out lever.
- e. Replace modified cam with new cam (double depth).

#### Single Column

- a. Remove bucket filler.
- b. Install 1/4" form spacer and 2 shims.
- c. Install anti-tilt wire.
- d. Replace short sold-out lever with standard sold-out lever.
- e. Replace modified cam with new cam (double depth).

### 3. to 10 oz. Polylabeled Bottle

#### Staggered Column

- a. Remove 16 oz. bail bracket and stack brace.
- b. Install 12 oz. bail bracket with wide flange to rear of column.
- c. Install anti-tilt bracket, 1 per side of column.
- d. Replace short sold-out lever with standard sold-out lever.
- e. Replace modified cam with new cam (double depth).

#### Single Column

- a. Remove bucket filler.
- b. Install 1/4" form spacer.
- c. Install anti-tilt wire.
- d. Replace short sold out lever with standard sold-out lever.
- e. Replace modified cam with new cam (double depth).

### 4. to 10 oz. Returnable Bottle

#### Staggered Column

- a. Remove 16 oz. bail bracket and stack brace.
- b. Install 12 oz. bail bracket with wide flange to front of column.
- c. Install adjustable rail in the #2 position, 1 per side of column.
- d. Install 1 form spacer and 3 shims per side of column.
- e. Replace short sold-out lever with standard sold-out lever.

#### Single Column

- a. Install 3/8" form spacer and 3 shims.
- b. Replace flat backspacer with channeled backspacer.
- c. Replace short sold-out lever with standard sold-

### 5. to 16 oz. Returnable Bottle

#### Staggered Column

- a. Remove 16 oz. bail bracket and stack brace.
- b. Install 12 oz. bail bracket with wide flange to front of column.
- c. Replace short sold-out lever with standard sold-out lever.

#### Single Column

- a. Install 1/4" form spacer and 2 shims.
- b. Replace flat backspacer with channeled backspacer.
- c. Replace short sold-out lever with standard sold-out lever.

## E. FROM 10 OZ. RETURNABLE BOTTLE

### 1. to 10 oz. Can

#### Staggered Column

- a. Remove 12 oz. bail bracket, adjustable rails, and shims.
- b. Install 10 oz. bail bracket with wide flange to rear of column.
- c. Install anti-tilt bracket, 1 per side of column.
- d. Install can deflector (See page 17 for columns used).
- e. Replace modified cam with new cam (double depth).

#### Single Column

- a. Remove bucket filler.
- b. Install anti-tilt wire.
- c. Replace channeled backspacer with flat backspacer.
- d. Replace modified cam with new cam (double depth).

### 2. to 12 oz. Can

#### Staggered Column

- a. Remove adjustable rails, form spacers, and shims.
- b. Remove 12 oz. bail bracket and re-install with wide flange to rear of column.
- c. Install anti-tilt bracket, 1 per side of column.
- d. Replace modified cam with new cam (double depth).

#### Single Column

- a. Remove bucket filler, 3/8" form spacer, and shims.
- b. Install 1/4" form spacer and 2 shims.
- c. Install anti-tilt wire.
- d. Replace channeled backspacer with flat backspacer.
- e. Replace modified cam with new cam (double depth).

### 3. to 10 oz. Polylabeled Bottle

#### Staggered Column

- a. Remove adjustable rails, form spacers, and shims.
- b. Remove 12 oz. bail bracket and re-install with wide flange to rear of column.
- c. Install anti-tilt bracket, 1 per side of column.
- d. Replace modified cam with new cam (double depth).

#### Single Column

- a. Remove bucket filler, 3/8" form spacer, and shims.
- b. Install 1/4" form spacer
- c. Install anti-tilt wire.
- d. Replace channeled backspacer with flat backspacer.
- e. Replace modified cam with new cam (double depth).

### 4. to 16 oz. Polylabeled Bottle

#### Staggered Column

- a. Remove 12 oz. bail bracket, form spacers, shims, and adjustable rails.
- b. Install 16 oz. bail bracket.
- c. Replace sold-out lever with short sold-out lever.
- d. Install stack brace.

#### Single Column

- a. Remove 3/8" form spacer and shims.
- b. Replace sold-out lever with short sold-out lever.
- c. Replace channeled backspacer with flat backspacer.

### 5. to 16 oz. Returnable Bottle

#### Staggered Column

- a. Remove adjustable rails, form spacers, and shims.

#### Single Column

- a. Remove 3/8" form spacer and shims.
- b. Install 1/4" form spacer and 2 shims.

## F. FROM 16 OZ. RETURNABLE BOTTLE

### 1. to 10 oz. Can

#### Staggered Column

- a. Remove 12 oz. bail bracket.
- b. Install 10 oz. bail bracket with wide flange to rear of column.
- c. Install form spacer, 1 per side of column.
- d. Install anti-tilt bracket, 1 per side of column.
- e. Install can deflector (See page 17 for column used).
- f. Replace modified cam with new cam (double depth).

#### Single Column

- a. Remove bucket filler, 1/4" form spacer, and shims.
- b. Install anti-tilt wire.
- c. Install 3/8" form spacer and 3 shims.
- d. Replace channeled backspacer with flat backspacer.
- e. Replace modified cam with new cam (double depth).

### 2. to 12 oz. Can

#### Staggered Column

- a. Remove 12 oz. bail bracket and re-install with wide flange to rear of column.
- b. Install anti-tilt bracket, 1 per side of column.
- c. Replace modified cam with new cam (double depth).

#### Single Column

- a. Remove bucket filler.
- b. Install anti-tilt wire.
- c. Replace channeled backspacer with flat backspacer.
- d. Replace modified cam with new cam (double depth).

### 3. to 10 oz. Polylabeled Bottle

#### Staggered Column

- a. Remove 12 oz. bail bracket and reinstall with wide flange to rear of column.
- b. Install anti-tilt bracket, 1 per side of column.
- c. Replace modified cam with new cam (double depth).

#### Single Column

- a. Remove bucket filler and shims.
- b. Install anti-tilt wire.
- c. Replace channeled backspacer with flat backspacer.
- d. Replace modified cam with new cam (double depth).

### 4. to 16 oz. Polylabeled Bottle

#### Staggered Column

- a. Remove 12 oz. bail bracket.
- b. Install 16 oz. bail bracket.
- c. Install stack brace.
- d. Replace sold-out lever with short sold-out lever.

#### Single Column

- a. Remove 1/4" form spacer and shims.
- b. Replace sold-out lever with short sold-out lever.
- c. Replace channeled backspacer with flat backspacer.

### to 10 oz. Returnable Bottle

#### Staggered Column

- a. Install adjustable rail in the #2 position, 1 per side of column.
- b. Install 1 form spacer and 3 shims, per side of column.

#### Single Column

- a. Remove 1/4" form spacer and shims.
- b. Install 3/8" form spacer and 3 shims.

## OPERATING PRINCIPLES

The following section deals with how the vender works. The information is provided to show how the vender should work when all parts function properly.

This section is divided into four parts:

- (I) Detailed mechanical vend cycle - staggered (wide) columns;
- (II) Detailed mechanical vend cycle - single (narrow) columns;
- (III) Detailed electrical vend cycle - (including step by steps);
- (IV) Refrigeration operation and cycle.

## I. MECHANICAL OPERATIONS - STAGGERED (WIDE) COLUMNS.

### A. Parts Description. See FIGURE 42.

#### 1. Motor (P/N 385418)

The motor is shaded pole, 115 volt, 60 hertz, impedance protected with spring type (with pad) brake system. It is mounted to the front of the stack, centered on each column. When a selection is made, the motor rotates the bail, via the link assembly. Its run time is controlled by the motor cam and the motor switch assembly.

#### 2. Motor Cam (P/N 387350)

The motor cam is molded green, high impact polystyrene. It has four (4) lobes, two of which can easily be (permanently) removed; The cam is mounted to the motor assembly with two screws. It also actuates the motor carrier and by-pass switches, via the switch actuator levers. It also retains the link assembly to the motor assembly.

#### 3. Switch Levers (P/N 384842, Motor Carrier; P/N 384843, By-Pass)

The switch levers are molded black high impact polystyrene. They are mounted to the switch bracket so that when the lobes of the motor cam pass over the "lobes" of the levers, the motor switches are actuated.

#### 4. Motor Carrier Switch (P/N 368299)

The Carrier Switch is 10 AMP., 125/250 volt switch with a plastic "Knob" actuator. It is mounted to the switch bracket behind the by-pass switch. It is mounted so that it is actuated when its switch lever is "pressed" upon by a motor cam lobe. The carrier switch provides a circuit to run the motor.

#### 5. By-Pass Switch (P/N 368299)

The By-Pass switch is a 10 AMP., 125/250 volt switch with a plastic "Knob" actuator. It is mounted to the switch bracket in front of the carrier switch. It is mounted so that it is actuated when its switch lever is "pressed" upon by a motor cam lobe. The by-pass switch provides a safety circuit in case of a product jam or motor failure.

#### 6. Electronic Selection Board (P/N 387879 or P/N 388368)

The purpose of the Electronic Selection Board is to insure an immediate response to the selection made. (It is not to be trouble shooted, due to the complex circuitry involved.) See trouble shooting section.

#### 7. Switch Bracket (P/N 131989)

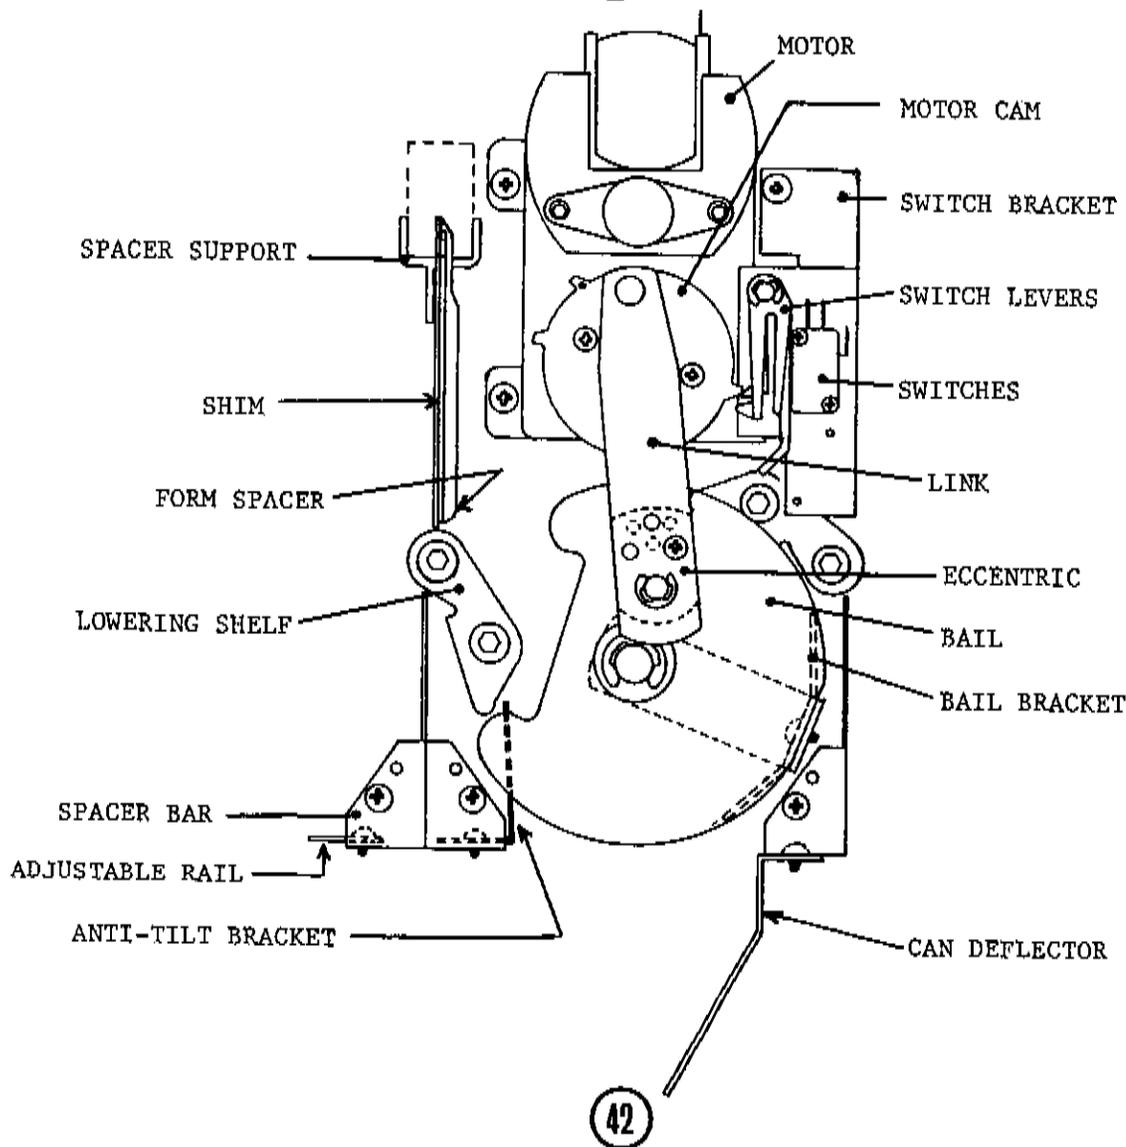

The switch bracket is mounted to the stack, to the right side of the motor assembly. It provides a mounting platform for the motor switches and switch levers.

#### 8. Link Assembly (P/N 132260)

The link is mounted to the motor (hub) assembly and to the bail. It is held in place on the motor assembly by the motor cam and on the bail by an "E" ring retainer. The link transmits the rotational force of the motor to an up and down "rocking" force to the bail.

#### 9. Eccentric (P/N 385983)

The Eccentric is mounted to the link assembly at the bail end. By adjusting the eccentric left or right increases or decreases "length of travel" of link to maintain an equal left and right travel of bail.

10. **BAIL** (P/N 131578)  
The bail is mounted inside the stack and to the link. It is supported in the rear by a pin and in the front by a staked in brass bushing. It is secured in place by an "E" ring retainer. The bail and bail bracket receives the product from the lowering shelves. When rotated (rocked in an 140 degree total arc), the bail delivers product to the delivery chute.
11. **Bail Bracket** (P/Ns: 12 oz. = 387282; 10 oz. = 387462, 16 oz. = 387283)  
The Bail Bracket is mounted directly to the bail with either the wide flange forward (single depth) or at the rear of column (double depth). Along with spacer bar provides support for "next to be vended" product.
12. **Lowering Shelf** (P/Ns: Left - 123916-1; Right - 124255-1)  
The Lowering Shelves are mounted to the inside of the stack, one on each side of column. They are supported in the rear by a pin and in front by a screw. The shelves support product in column and deposit product to bail area. They are raised and lowered by rotating bail.
13. **Spacer Bar** (P/Ns: Left - 387281; Right - 387427; Center - 132828)  
The Spacer Bars are mounted inside of the stack, one directly beneath each staggered column partition. They are inserted into a slot in rear of stack, and supported by screws in front. Along with the bail bracket provides support for "next to be vended" product.

14. Adjustable Rail (P/N 387279)  
The Adjustable Rail is mounted to the spacer bar with two screws. It provides support for "next to be vended" product in a single depth mode. It adjusts the space between spacer bar and bail bracket to hold smaller diameter products.
15. Form Spacer (P/Ns: Left - 106284-1; Right - 106284-2)  
The Form Spacers are mounted on a support spacer in rear of column and in slot in front of stack. They are used to control column width just prior to vend mechanism. They are designed for right and left sides of column with stainless steel covered portion towards front and center of column.
16. Shims (P/N 370864)  
The Shims are mounted on a support spacer in rear of column in slot in front of stack, and behind form spacers. They are used to provide additional column width control.
17. Spacer Supports (P/Ns: Center - 384990; End - 385593)  
Spacer Supports are mounted in slot in rear of each column partition. They are used as a rear support of form spacers and shims.
18. Anti-Tilt Bracket (P/N 387319)  
The Anti-Tilt Bracket is the bracket mounted to the center of the spacer bar, one on each side of column. It is used on double depth mode (only) to prevent rear product for sliding into front product space and "free" vending when machine is tilted forward.
19. Can Deflector (P/N 387352 [10 oz. cans only])  
The Can Deflector is mounted to the front of the spacer in the center columns. It is used on double depth mode (only) to prevent cans from "standing up" on delivery chute.

## B. Mechanical Vend Cycle

The following vend cycles for "double" and "single" depth, describe what occurs mechanically when the motor is started (electrically). For a detailed description of what occurs electrically refer to the electrical vend-cycles and step by steps (pages 35 thru 48). For parts identification refer to FIGURE 42, Page 28 and parts descriptions pages 27 thru 29.

Each column consists of an individual motor assembly and switches, which are controlled by the coin mechanism, credit relay and the selection switch circuit. Mechanically the column vend mechanism consists of a link assembly, bail assembly, lowering shelves, and spacer bars.

1. Double Depth: When vending any product double depth, the motor cam (green) will have four lobes. The column will vend four products for each 360 degree rotation of the motor cam.

With the column properly loaded and primed, there will be two products supported between a bail bracket (on the bail) and a spacer bar (at the bottom of the partition). One lowering shelf will be DOWN. The opposite shelf will be UP, supporting the remaining product in that column.

On the first vend, from this "start" position, the motor will rotate the bail just enough to release the FRONT product, to the delivery chute, then stop. On the next vend, the REAR product is "VENDED", the motor continues to run (rotating the bail). The "Up" shelf is lowered depositing two (2) products on the bail. The "Down" shelf is raised to support the remaining product in the column. This process is repeated on the third and fourth vends, returning the lowering shelves to their original positions.

This entire process, vending two products from each side of column, is repeated for every 360 degree rotation of the motor cam.

2. Single Depth: When vending any product single depth, the motor cam (white) will have two lobes. The column will vend two products every 360 degrees rotation of the motor cam.

With the column properly loaded and primed, there will be one product supported between a bail bracket (on the bail) and a spacer bar (at the bottom of the partition). One lowering shelf will be DOWN. The opposite shelf will be UP, supporting the remaining product in that column.

When the bail is rotated by the motor, the product on the bail is deposited to the delivery chute. The motor continues to run, lowering the "Up" shelf, depositing a product to the bail. The "Down" shelf is raised to support the remaining product in column. The motor stops. On the next vend, this process is repeated from the opposite side of column.

The entire procedure, vend one product from each side of column is repeated for every 360 degree rotation of the motor cam.

## II. MECHANICAL OPERATION - SINGLE (NARROW) COLUMNS.

### A. Parts Descriptions. See FIGURE 43

#### 1. Motor (P/N 385418)

The Motor is a shaded pole, 115 volt, 60 hertz, impedance protected with a spring type (with pad) brake system. It is mounted to the front of the stack, centered on the column. The motor rotates the bail bucket (via the link and crank assemblies). its run time is controlled by the motor cam and motor switches.

#### 2. Motor Cam (P/N 385893)

The Motor Cam is molded white, high impact polystyrene. It has two (2) lobes, one of which can easily be (permanently) removed. It is mounted to the motor assembly with two screws. The cam actuates the motor carrier and by-pass switches, via the switch actuator levers.

#### 3. Switch Levers (P/N: Motor Carrier - 385623; By-Pass - 385624)

The Switch Levers are molded black high impact polystyrene. They are mounted to the switch bracket so that when the lobes of the motor cam pass over the "lobes" of the levers, the motor switches are actuated.

#### 4. Motor Carrier Switch (P/N 368299)

The Carrier Switch is 10 AMP, 125/250 volt switch with a plastic "knob" actuator. It is mounted to the switch bracket in front of the by-pass switch. The carrier switch is mounted so that it is actuated when its switch lever is "pressed" upon by the motor cam. The carrier switch provides a circuit to run the motor.

#### 5. By-Pass Switch (P/N 368299)

The By-Pass Switch is a 10 AMP, 125/250 volt switch with a plastic "knob" actuator. It is mounted to the switch bracket behind the motor carrier switch. The by-pass switch is mounted so that it is actuated when its switch lever is "pressed" upon by the motor cam. It provides a safety circuit in the event of a product jam or motor failure.

#### 6. Switch Bracket (P/N 132028)

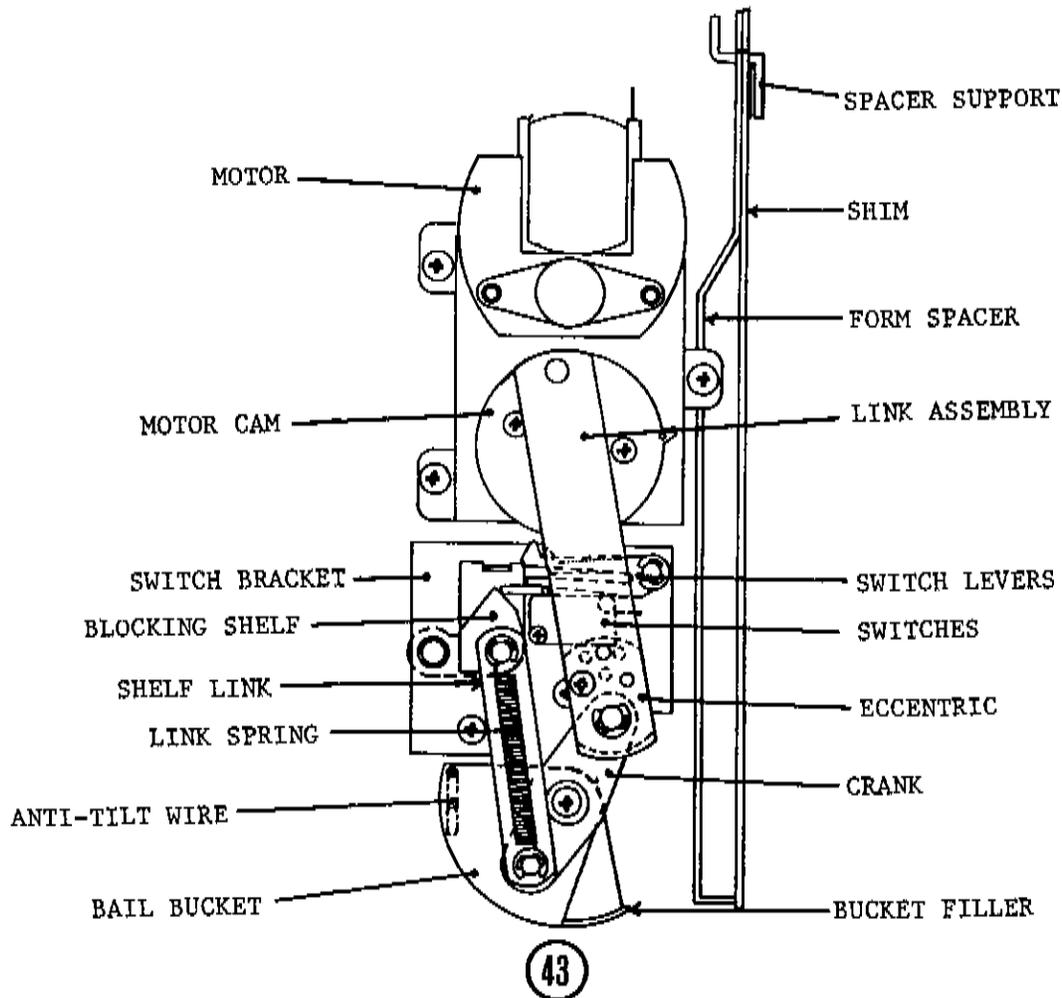

The Switch Bracket is mounted to the stack front mech plate, between the mech plate, crank and link assemblies. It is held in place by two screws. The switch bracket provides a mounting platform for the motor switches and switch levers. Also provides front mounting pin for blocking shelf and "traps" front pivot of bail bucket in place.

#### 7. Link Assembly (P/N 132819)

The Link is mounted to the motor (hub) assembly and to the crank. It is held in place by the motor cam on the motor and by an "E" ring retainer on the crank. The link transmits the rotational force of the motor to an up and down force to the crank.

#### 8. Eccentric (P/N 385593)

The Eccentric is mounted to the crank end of the link assembly. By adjusting the eccentric left or right, increases or decreases "length of travel" of link and crank. This is used to compensate for wear or any deviation in the column.

9. Crank (P/N 131988)  
The crank is mounted directly to the bail bucket. It is held in place by a washer head screw fastened to the bail bucket. The crank provides an 180 degree arc rotational force to the bail via the link assembly. It also provides an up and down force to the shelf link.
10. Bail Bucket (P/N 385589)  
The Bail Bucket is mounted inside the stack and to the crank. It is supported by a nylon bushing at both front and rear pivot points. The bucket is "secured" in place by the switch bracket assembly. It receives the product from the column and delivers it to the column when rotated.  
**CAUTION: BAIL BUCKET MUST BE INSTALLED SO THAT BUCKET IS 'OPEN' TOWARDS TOP RIGHT SIDE OF COLUMN.**
11. Shelf Link (P/N 385580)  
The blocking Shelf Link is mounted to the crank and blocking shelf and retained by an "E" ring retainer at each end. The slotted end attaches to the crank. The link drives the blocking shelf up and down as the crank is pivoted.
12. Blocking Shelf (P/N 387197)  
The blocking shelf is mounted inside the stack. It pivots on two pins, one at the rear of the stack, the other is part of the switch bracket assembly. It provides support for product in the column. The shelf is raised to allow product into the bail area, and lowered to provide product support. It is raised and lowered by the shelf link, which is assisted by a spring.

13. Link Spring (P/N 385728)  
The Spring is mounted directly to the shelf pin and crank (link) pin. The spring provides a downward tension for the blocking shelf.
14. Form Spacer (P/N 1/4" = 387231; 3/8" - 387258)  
The Form Spacer is mounted on the right side of column, in hole in front of stack and on a spacer support, in rear of column. They are used to control the column width in the vend mechanism area. They are designed so that the wide tab rests on support, narrow tab in hole in front of stack and bottom lips edge flush against partition wall (or shim).
15. Shim (P/N 387230)  
The Shims are mounted directly behind the form spacer. The shim(s) are used to provide additional column width control in the vend mechanism area.
16. Spacer Support (P/N 385593)  
The Support is mounted on right side of column in rear. It is used as the rear support for the form spacer and shims(s)
17. Anti-Tilt Wire (P/N 387391)  
The Anti-Tilt Wire is mounted in holes in each end of the bail bucket. It hangs inside the bucket and is used in the double depth mode (only). It prevents rear product from sliding into front product space and "free" vending when machine is tilted forward.
18. Bucket Filler (P/N 387171)  
The Filler is mounted to the inside curve of bail bucket. It is positioned so as to prevent tipping of product in the single depth mode (only).

## B. Mechanical Vend Cycle

The following vend cycles, for "single" and "double" depth, describes what occurs in the single column mechanically when the motor is started (electrically). For a detailed description of what occurs electrically, please see the electrical vend cycle and Step by Steps (pages 35 thru 48). For parts identification see FIGURE 43 (page 32) and parts description (pages 31 thru 33)

Each single column is operated by an individual motor and switch assembly. The vend mechanism consists of a link assembly, crank, bail bucket, shelf link, and a blocking shelf.

1. Single Depth: When vending any product single depth, the motor cam (white) will have one lobe (one removed). The column will vend one product for every 360 degree rotation of the motor cam.
2. With the column properly loaded and primed there will be one product in the bail bucket and supported between the bail bucket and partition (or form spacer). The blocking shelf will be in its Down position supporting the remaining product in the column. When the motor runs the cam rotates, turning the crank (Via the link). The crank on the link side is pushed Down, which rotates the bail bucket, depositing product to delivery chute. The other end of the crank is rotated Up which raises the blocking shelf depositing all product in column on top of the bail bucket. The motor continues to run causing crank (and therefore bail bucket and blocking shelf) to reverse direction. As this happens, one product is deposited in the bucket, while the blocking shelf is lowered, blocking (supporting) the remaining product in the column. The cam has now rotated 360 degrees. This process will occur for each vend.
2. Double Depth: When vending any product double depth, the motor cam (white) will have two lobes. For every 360 degree rotation of the motor cam the column will vend two products.

With the column properly loaded and primed, there will be two products supported between the bail bucket and partition (or form spacer) of column. The remaining product in column is supported by the blocking shelf. When the motor runs, the bucket is rotated just enough to deposit the front product to delivery chute. On the next vend the motor will run and deposit the rear product to the chute and continues to run. The blocking shelf is raised to deposit product in column on top of bail bucket. The crank (and bail bucket and blocking shelf) reverse direction, depositing two products in bail bucket. The blocking shelf is lowered, supporting the remaining product in the column. The motor now stops running. The cam has now completed a 360 degree rotation. This process of vending two products will occur for every 360 degree rotation of the motor cam.

## III. ELECTRICAL OPERATIONS

### A. PARTS DESCRIPTION

#### 1. Coin Mechanism (purchased separately)

The Coin Mech (coinage) is mounted to the coinage panel directly behind the selection buttons. It provides coin validation rejection of vend switch (circuit). It stores and pays out change when required.

#### 2. Credit Relay (P/N 353343)

The Credit Relay is mounted to the inside of the control panel above the selection switches. It provides Line 1 path circuit to carrier switches and coinage (in stand-by) and Line 1 power circuit to selection switches when energized (power credit established).

#### 3. Selection Switch (Different Part Numbers for Various Equipment -- See Control Panel Page)

The Selection Switch is a 15 AMP, 125/250 volt switch. It is mounted directly behind the selection buttons and is actuated when the selection button is pushed. With credit established the selection switch provides Line 1 to start selected motor.

#### 4. Motor Carrier Switch (P/N 368299)

The Motor Carrier Switch is a 10 AMP, 125/250 volt switch. Actuation of this switch the first time de-energizes the credit relay and provides circuit path to run the motor. When actuated the second time, it stops the motor.

#### 5. By-Pass Switch (P/N 368299)

The By-Pass Switch is a 10 AMP, 125/250 volt switch. It is only momentarily actuated. If not actuated or motor fails to complete its cycle, will provide credit hold circuit so that remaining columns remain functional.

#### 6. Sold-Out Switches (P/N 368299)

Sold-Out Switches are 10 AMP, 125/250 volt switches. They are mounted to the front of the sold-out channel, centered on column directly above the motor assembly. They are mounted with the "B" behind the "A" switch.

"A" Switch: Lights that column sold-out lamp and prevents a selection from that column if sold-out.

"B" Switch: Provides Line 1 power path to motor carrier switches and credit relay. If all selections are sold out vender will not accept money.

#### 7. Electronic Selection Board (P/N 387879 or P/N 388368)

The Electronic Selection Board is mounted in the lower right side (as facing back of opened door) of the outer door. It provides a delaying circuit to motors when a selection is made. It also helps to insure that only one motor at a time can run.

### B. Electrical Vend Cycle

The following cycle is a description of what occurs electrically during one complete vend cycle; i.e., one product delivered to customer. Single or Double depth is not a consideration electrically, as the same things happen each vend cycle whether 1, 2, or 4, products are vended for each 360 degree rotation of motor cam. Each time the motor runs the same electrical cycle occurs.

This electrical vend cycle assumes that the machine is completely prepared for customer use, machine plugged in, properly set-up, properly loaded and all parts functioning correctly.

# Vendo®

Refer to Step-by-Step (Pages 37 thru 48) for routing. When sufficient coins are deposited and are accepted, the coinage completes the vender credit circuit (vend switch pins 1 & 3) to energize the credit relay.

With the credit relay energized, a "credit holding" circuit is created through the motor carrier switches, at least one "B" sold-out switch and the credit relay. With the coinage vend switch returned to standby (Pins 1 & 7) a "selection circuit" is now available to all selection switches through the coinage vend switch and credit relay.

When a selection is made (selection switch actuated), a circuit is completed through the coinage vend switch, credit relay, the operated selection switch, sold switch "A" and to the Electronic Selection Board to insure a circuit is routed to the selected motor only. As soon as this circuit is completed, the selected column's motor starts. (Note: The selection must be held until the motor cam via the switch lever releases the motor carrier switch.)

When the motor cam actuates the motor carrier switch the first time, the credit relay de-energizes and circuit is canceled to the Electronic Selection Board, the carrier switch will provide a circuit to run the selected motor. (Note: While the motor is running the sold-out light will be on.)

The by-pass switch is operated momentarily during this cycle (See Step-by-Steps for a detailed explanation of this safety feature.).

When a motor cam lobe reaches the carrier switch (actuating switch the second time), the motor stops (a product has been delivered to the customer). The vender has now been returned to its "stand-by position" (vender ready to accept money and start another vend cycle).

NOTE: The coin mechanism should refuse all coins if:  
(1) The credit relay is energized; (2) any vend motor is running; (3) all sold-out lights are "lit" or (4) there is no power supplied to the vender.

## C. ELECTRICAL STEP-BY-STEPS

### ABBREVIATIONS

C.R.E.M.....	Coin Return Electro Magnet
N.C.....	Normal Closed
N.O.....	Normal Open
C.....	Common
C.C.....	Correct Change

### SYMBOLS

	.....Switch
	.....Service Cord Line Plug
	.....Neon Lamp
	.....Coil
	.....Electrical Wire Junction
	.....Electrical Plug and Receptacle Identification

1. Standby

Line one power is supplied to energize the C.R.E.M. Coils through:  
a) Each motor carrier switch C.-N.O. contacts starting with the common of the last selection.

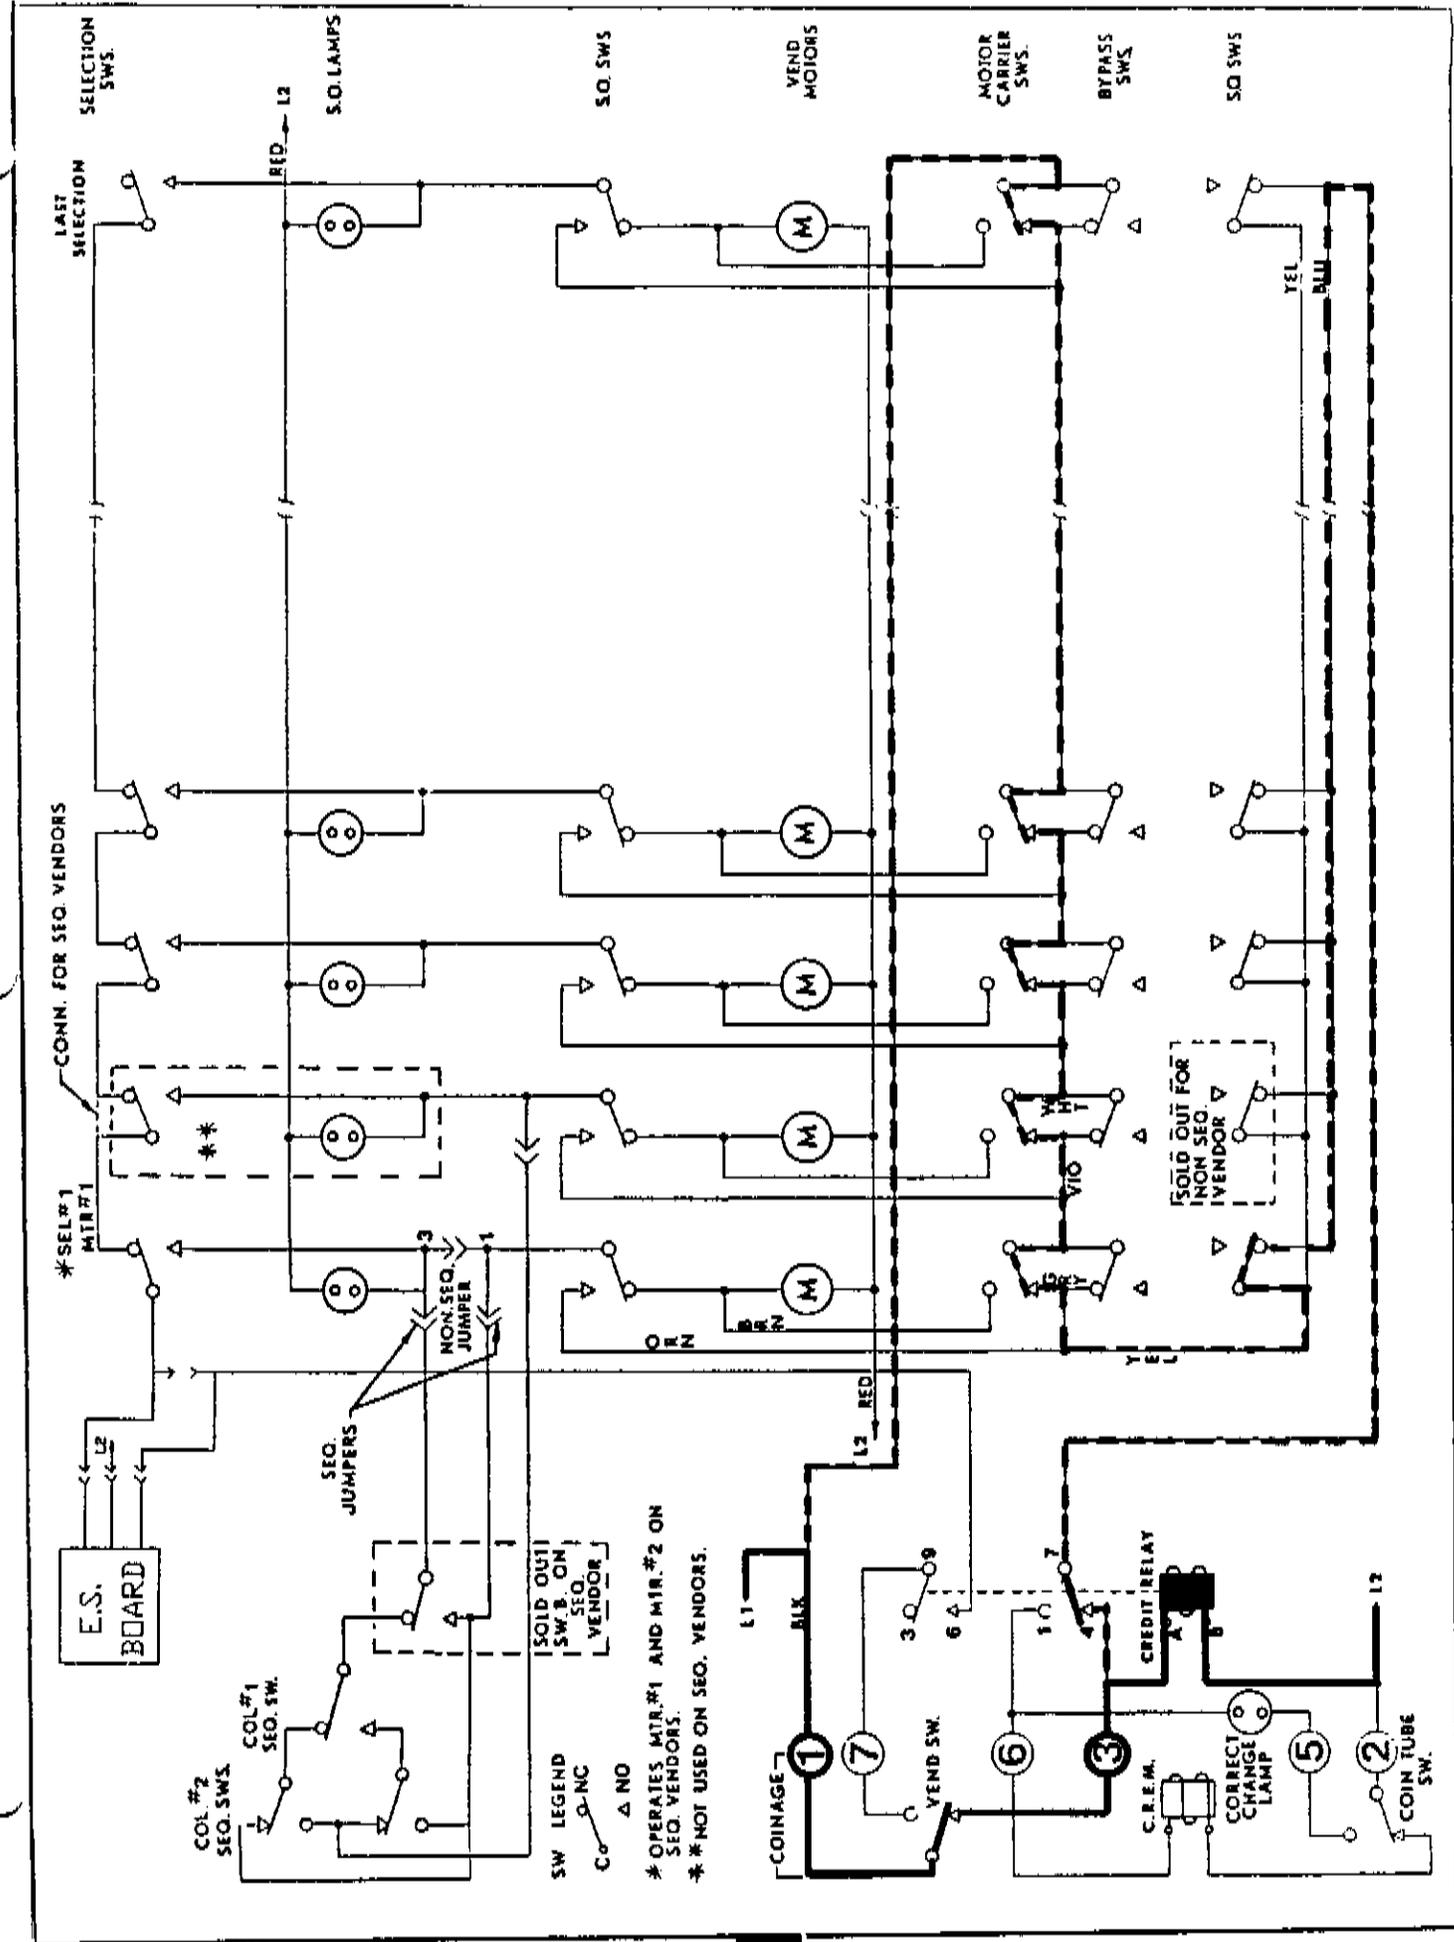

b) From the N.O. contact of the #1 selection motor carrier switch to the common contact of all sold-out switch "B"'s. (Product is any one of the sold out controlled column will allow the machine to accept money.)

c) Contacts #1 and #7 in the de-energized credit relay.

## 2. Credit Established

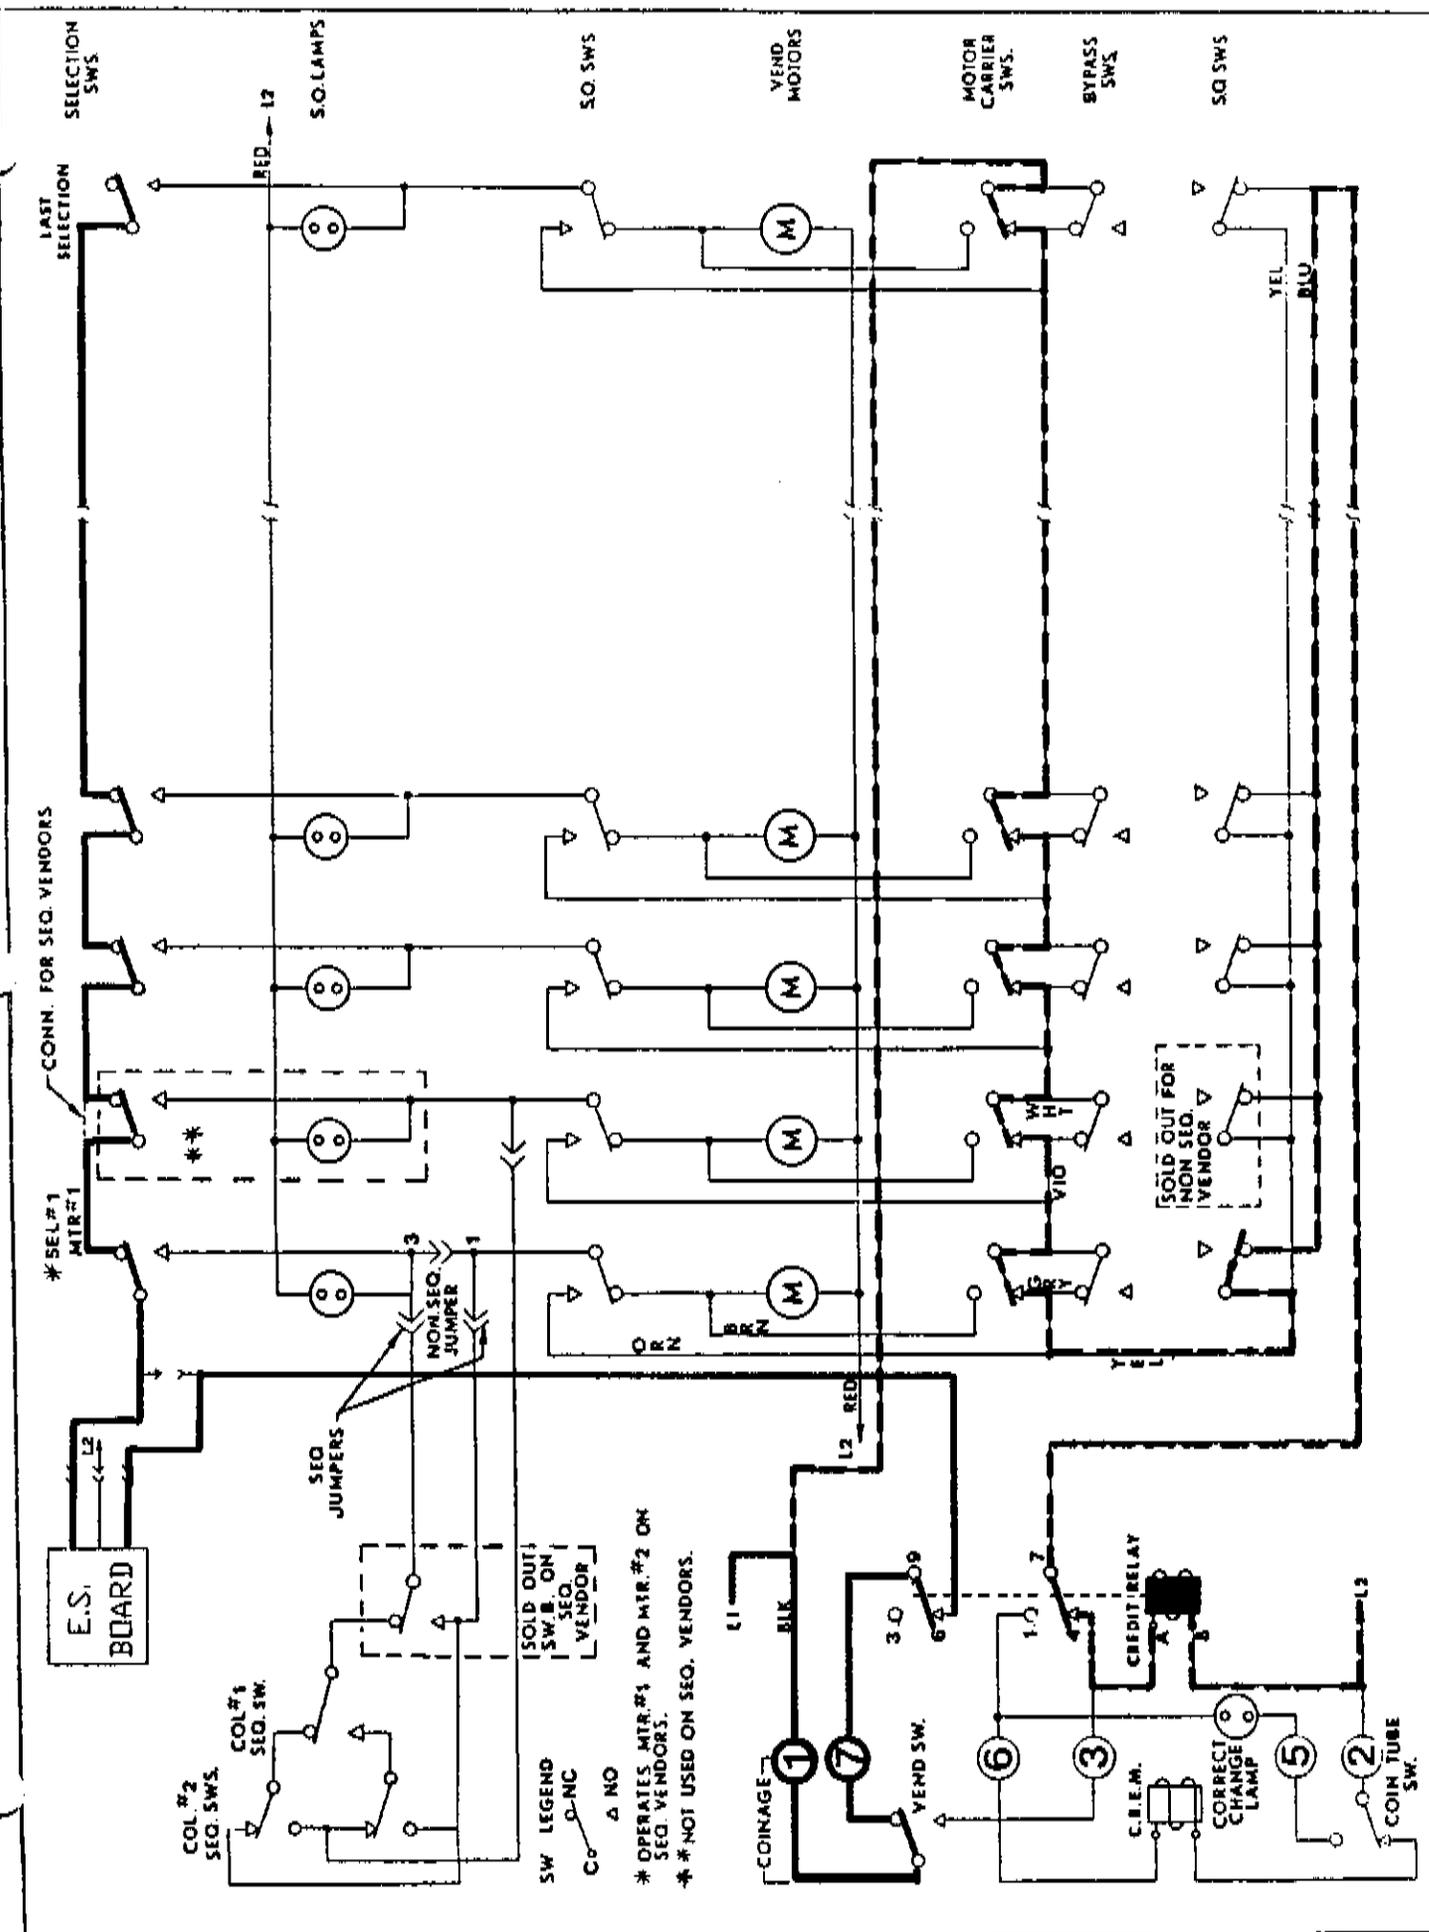

- a) When the proper amount of money is inserted, the coinage vend switch (circuit) is activated. Power is applied to the vender credit relay coil (sold line) via "A" and "B" terminal of the credit relay receptacle.
- b) When the credit relay is energized, a switch (Terminal #4 and #7 in the relay) provides a "hold" circuit for the credit relay. Note: This is the same circuit that provides a C.R.E.M. circuit when the vender is at "standby" (dotted line).

POWER ON, MACHINE LOADED 5,6,7,8 SELECTION

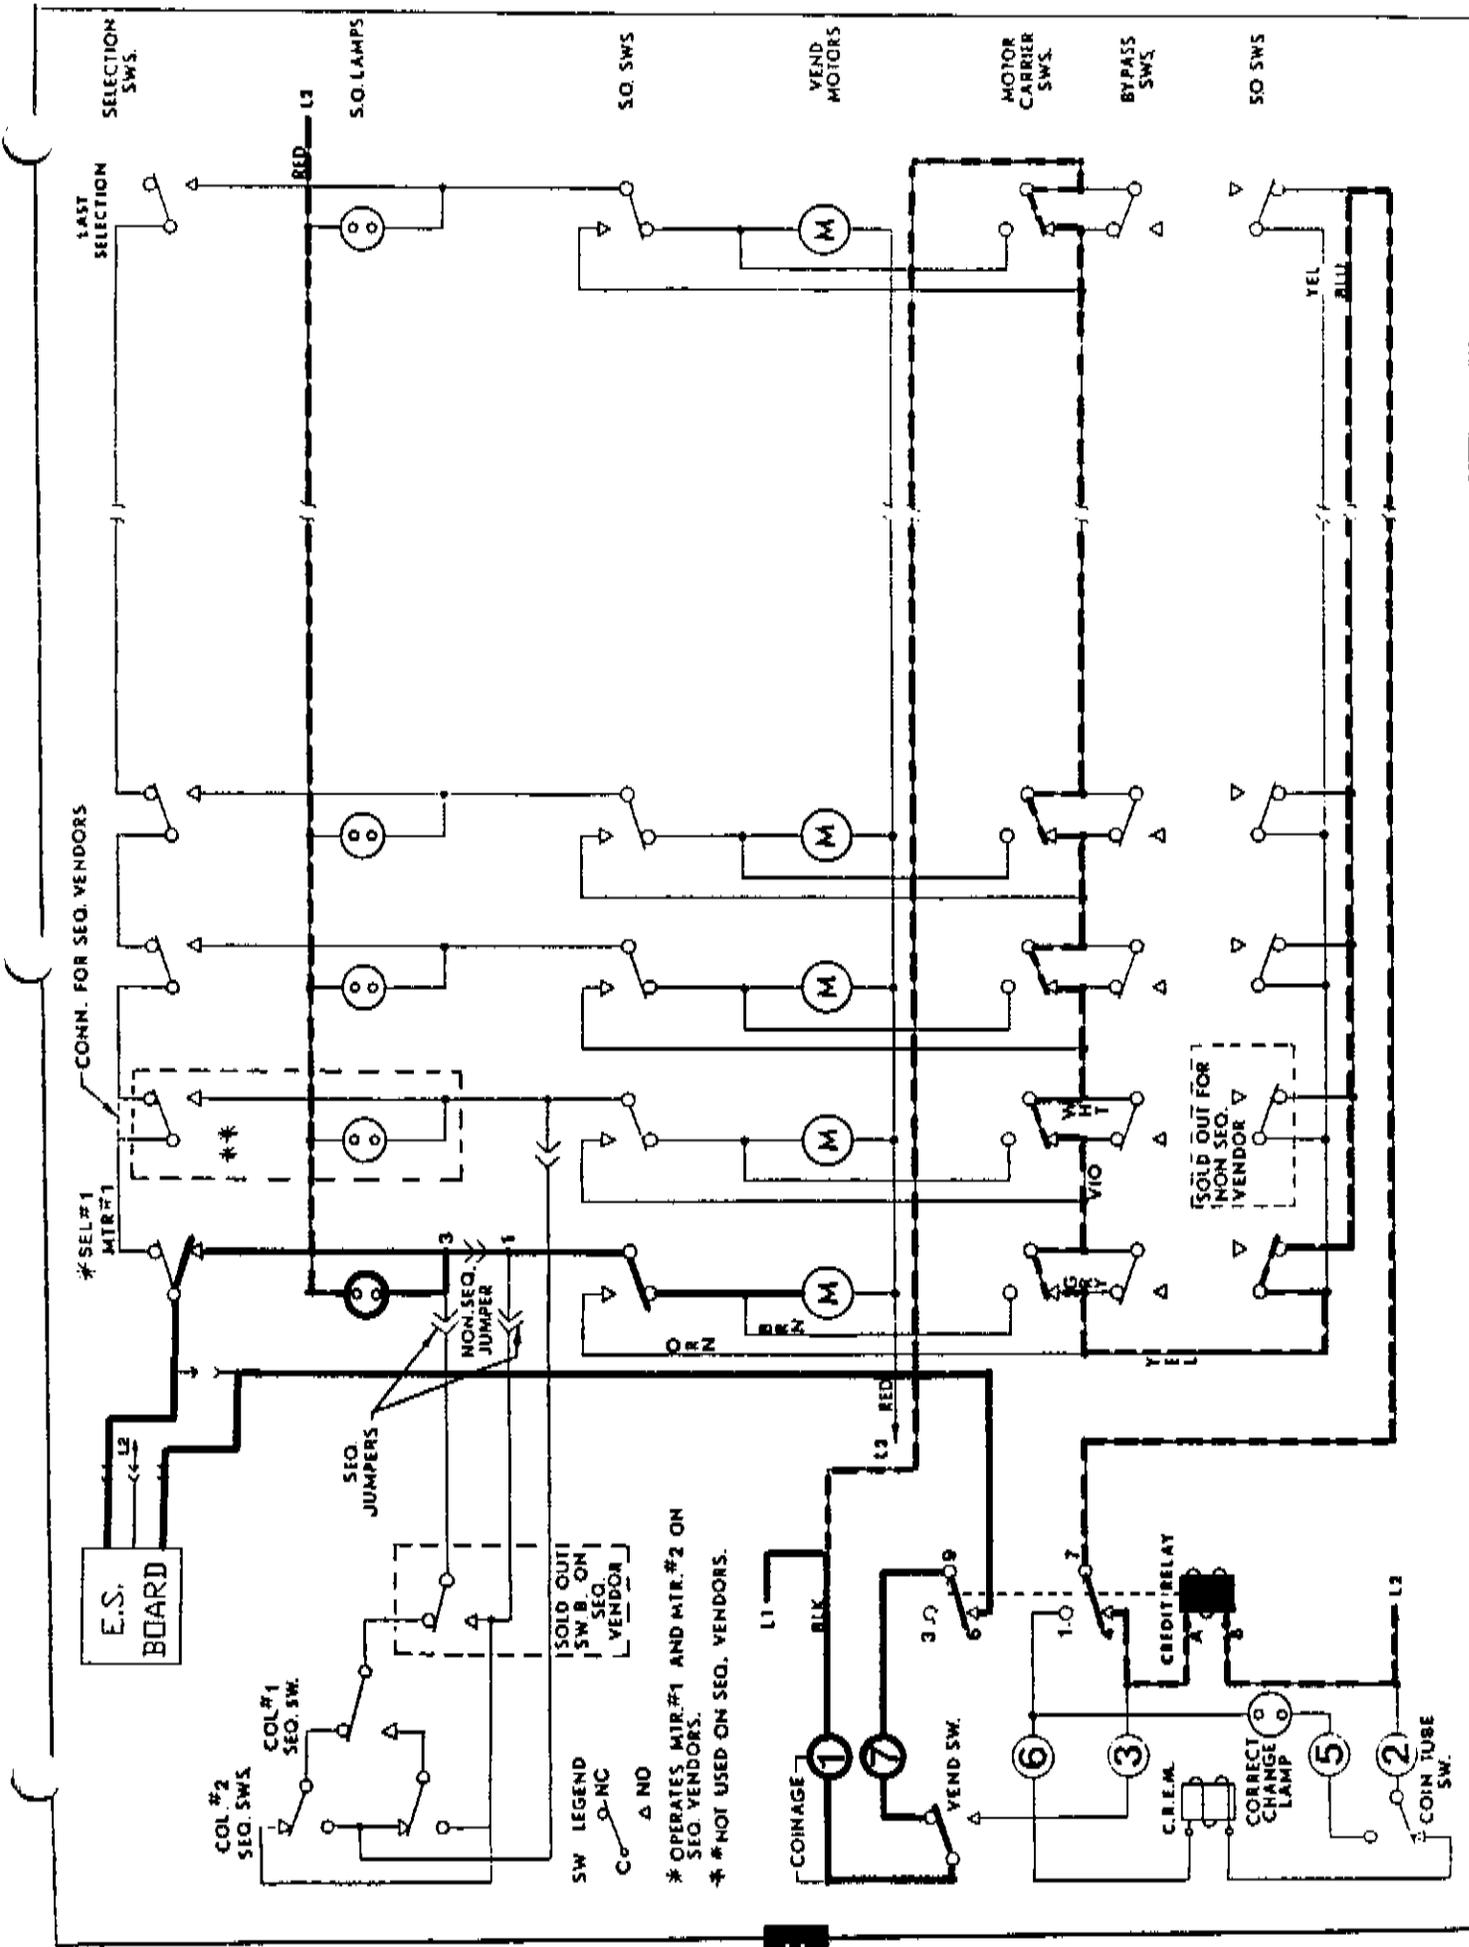

- 3. Vend Switch (Circuit)
  - a) When the coinage vend switch (circuit) returns to standby (coinage Pin 1 and Pin 7), all selection switches have line one applied through relay contacts #6 and #9.
  - b) The credit relay remains energized.

4. Selection Made - Motor Start

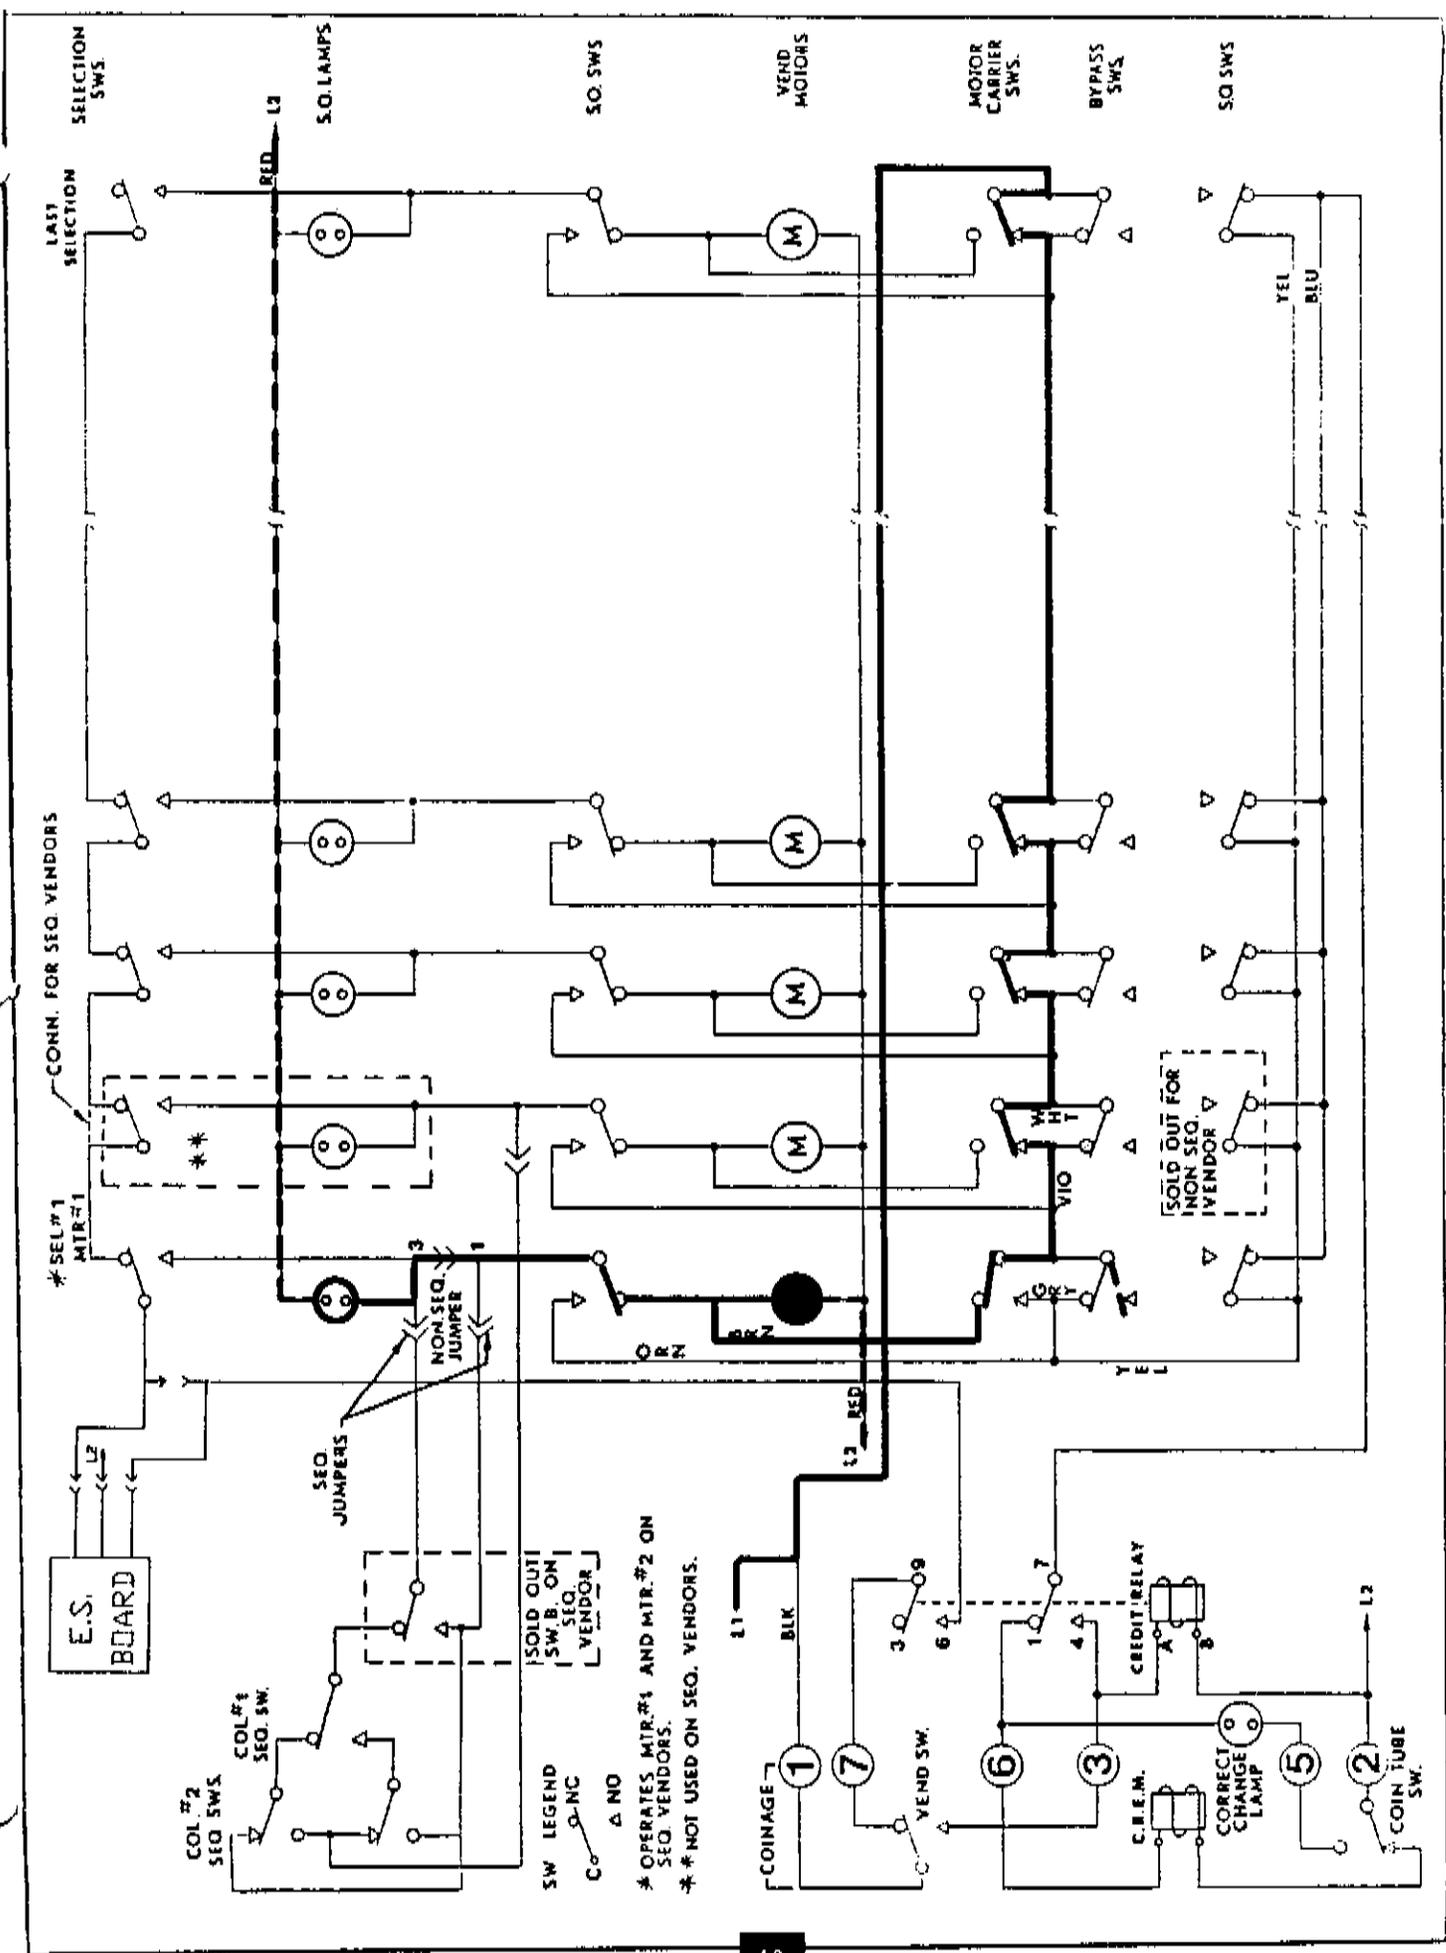

- a) When a push button selection switch is operated, a circuit is routed through the Electronic Selection Board to insure that a circuit is routed to the proper motor selected.
- b) The sold out lamp for that selection will light.
- c) The motor will continue to run only if the selection is held.
- d) The credit relay remains energized.

POWER ON, MACHINE LOADED 5,6,7,8 SELECTION

## 5. Selection Made - Motor Run

- a) When the motor carrier switch of selected motor leaves its cam, a motor circuit is provided to keep that motor running, and circuit to the Electronic Selection Board is canceled.
- b) The credit relay is de-energized.
- c) The sold out lamp stays on.
- d) The By-Pass switch is momentarily operated to normal open (N.O.) and then returns to its standby or by-pass position. Note: If the by-pass switch does not momentarily open, the credit relay will remain energized. (See By-Pass Circuit.)
- e) The motor will continue to run until the other side of coupling cam operates the motor carrier switch. At this point, the motor will stop. Vender is returned to "standby".

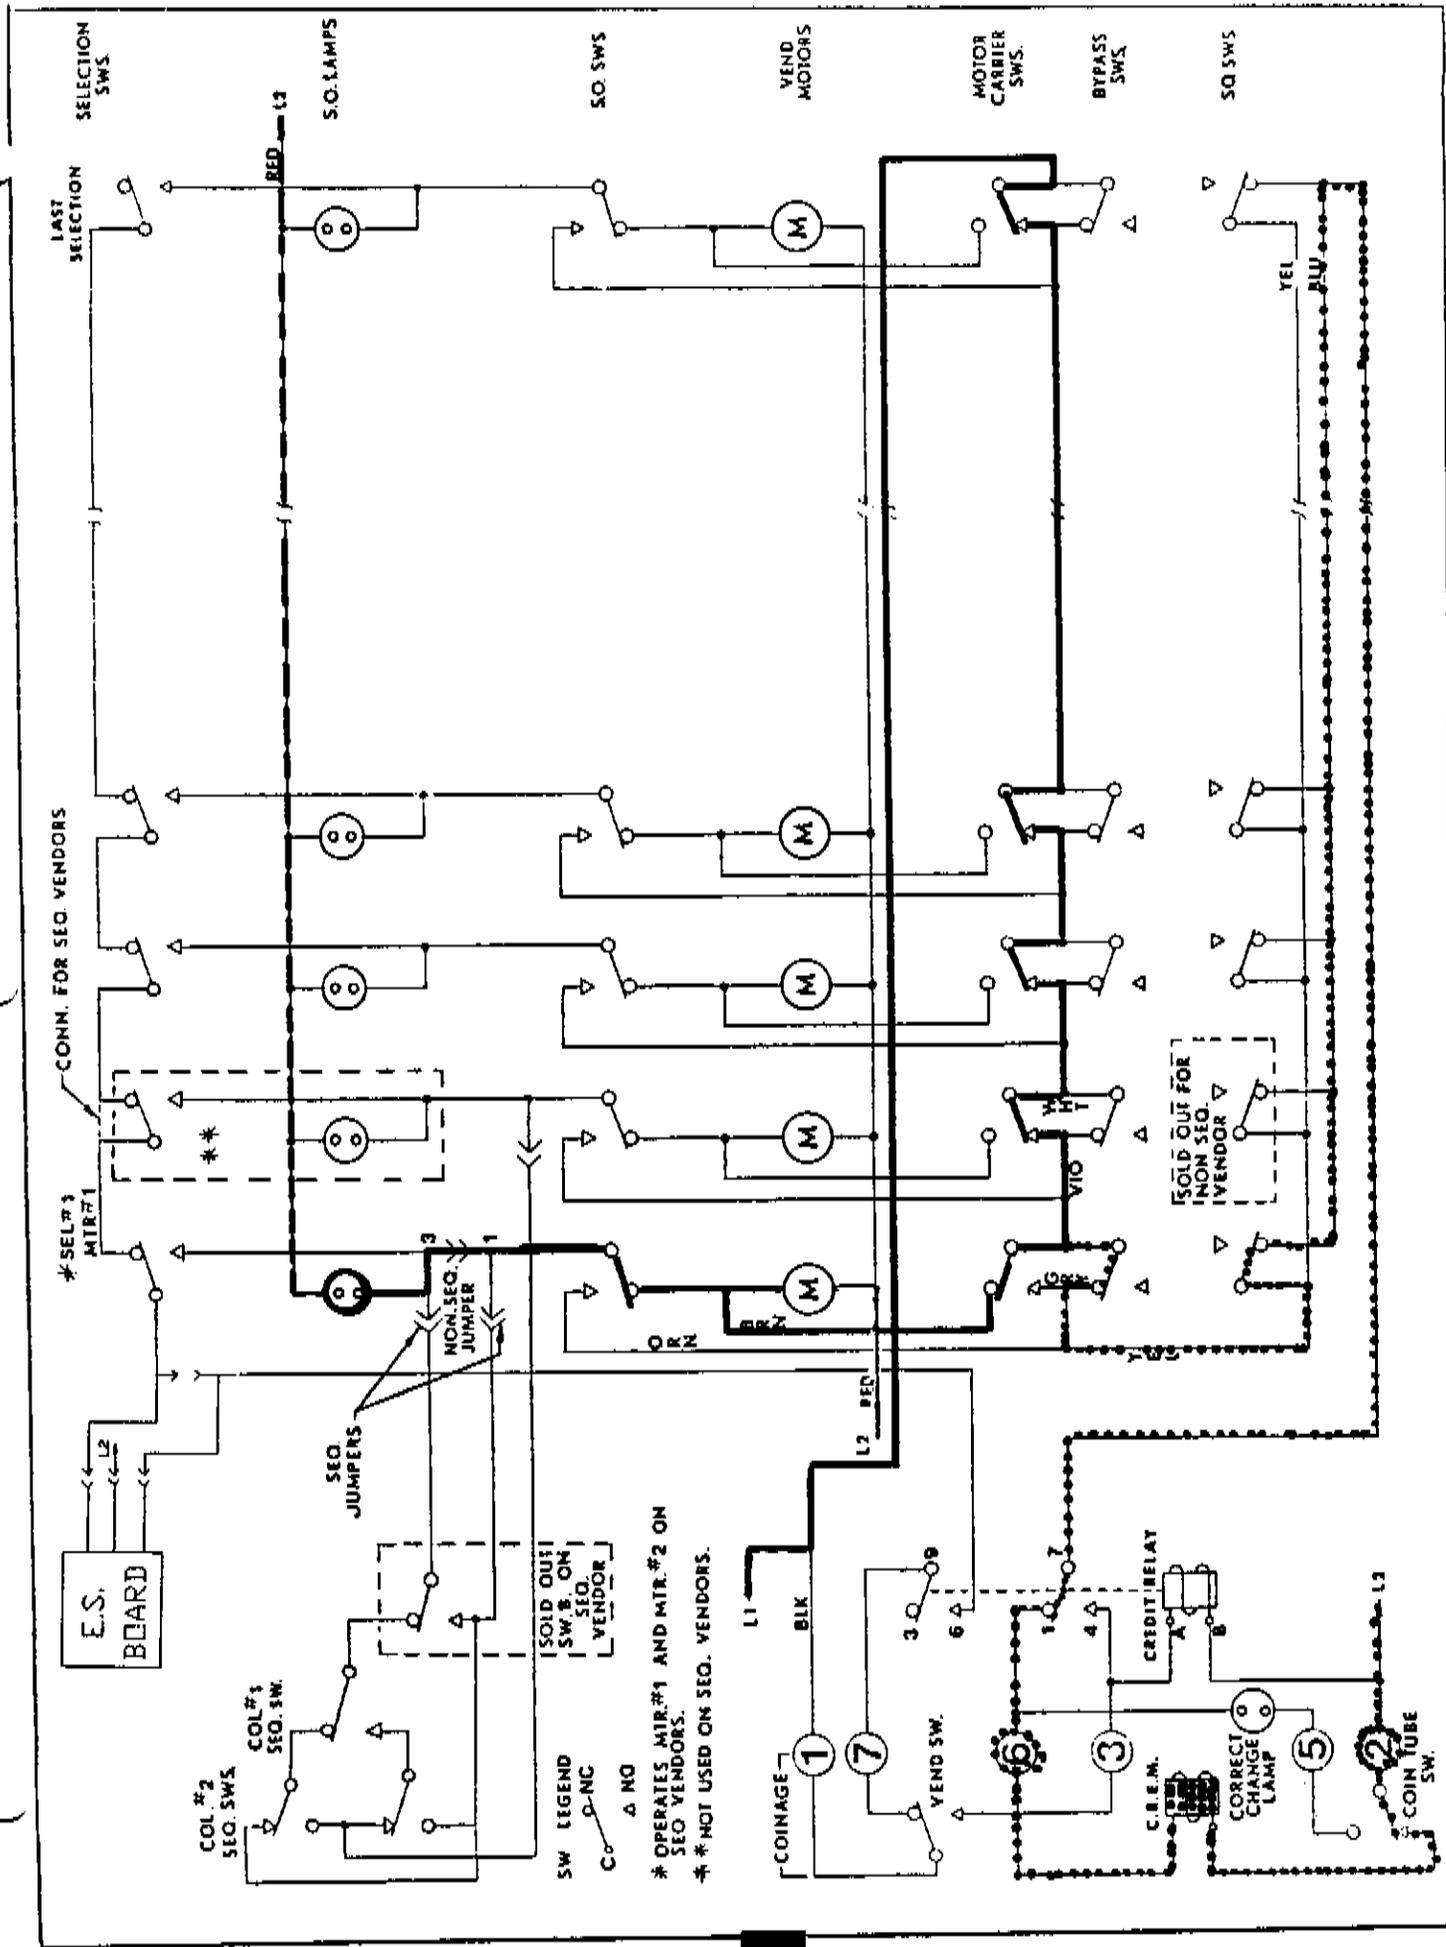

\* OPERATES MTR.#1 AND MTR.#2 ON SEQ. VENDORS.  
 \*\* NOT USED ON SEQ. VENDORS.

#### 6. By-Pass Circuit

If for some reason the vend motor receives power and starts but does not complete its cycle, the motor carrier switch will be open in the C.R.E.M. and credit relay hold circuit. The sold out will stay on.

The credit relay will be de-energized and depending on where the motor stopped that customer may or may not have received a product. However, in this condition, the by-pass switch will provide a C.R.E.M. and credit hold circuit so that all other selections will be functional.

**NOTE:** If the vend motor receives power but does not start, the power will be removed as soon as the selection button is released. The credit is still available and any other selection may be made.

## A. BASIC REFRIGERATION PRINCIPLE

What a refrigeration system really accomplishes is a transfer of heat. The refrigeration system removes the heat from one area, transfers it to another where the heat is dissipated to another. In vending machine application this process requires large quantities of heat to be transferred economically, efficiently, and that can be repeated continuously without loss of refrigerant over an extended period of time. The most common system used in the vending industry is the vapor compression (or simple compression) cycle system. It consists basically of three elements: an evaporator, a compressor, and a condenser, (all part of a "sealed" system).

In the compression system there are two existing pressures, the low (evaporating) pressure and the high (condensing) pressure. The refrigerant acts as the transportation medium in which heat is moved from the evaporator to the condenser, where it is discharged (into ambient air). A change of state from liquid to vapor and back to liquid allows a refrigerant to absorb and discharge large quantities of heat efficiently.

The basic vapor compression system cycle is described below.

In the evaporator the refrigerant boils (evaporates to a vapor) at a temperature sufficiently low enough to absorb heat from a space which is being cooled. The boiling temperature is controlled by the pressure maintained in the evaporator (the higher the pressure, the higher the boiling point). The compressor removes the vapor (via suction line) from the evaporator as it is formed at a rate sufficiently rapid enough to help maintain desired pressure. The compressor takes the low pressure vapor and compresses it, increasing both the pressure and temperature. The hot, high pressure gas is forced out the compressor discharge valve and into the condenser. The condenser dissipates the heat of the refrigerant vapor. As the temperature of the vapor decreases it is condensed into a liquid. This liquid flows from the condenser to the evaporator. This process in which the refrigerant absorbs heat at a low pressure and then, under action of mechanical work, is compressed and raised to a sufficiently high enough temperature to permit rejection of this heat is continuous as long as the compressor runs.

## B. DETAILED REFRIGERATION CYCLE

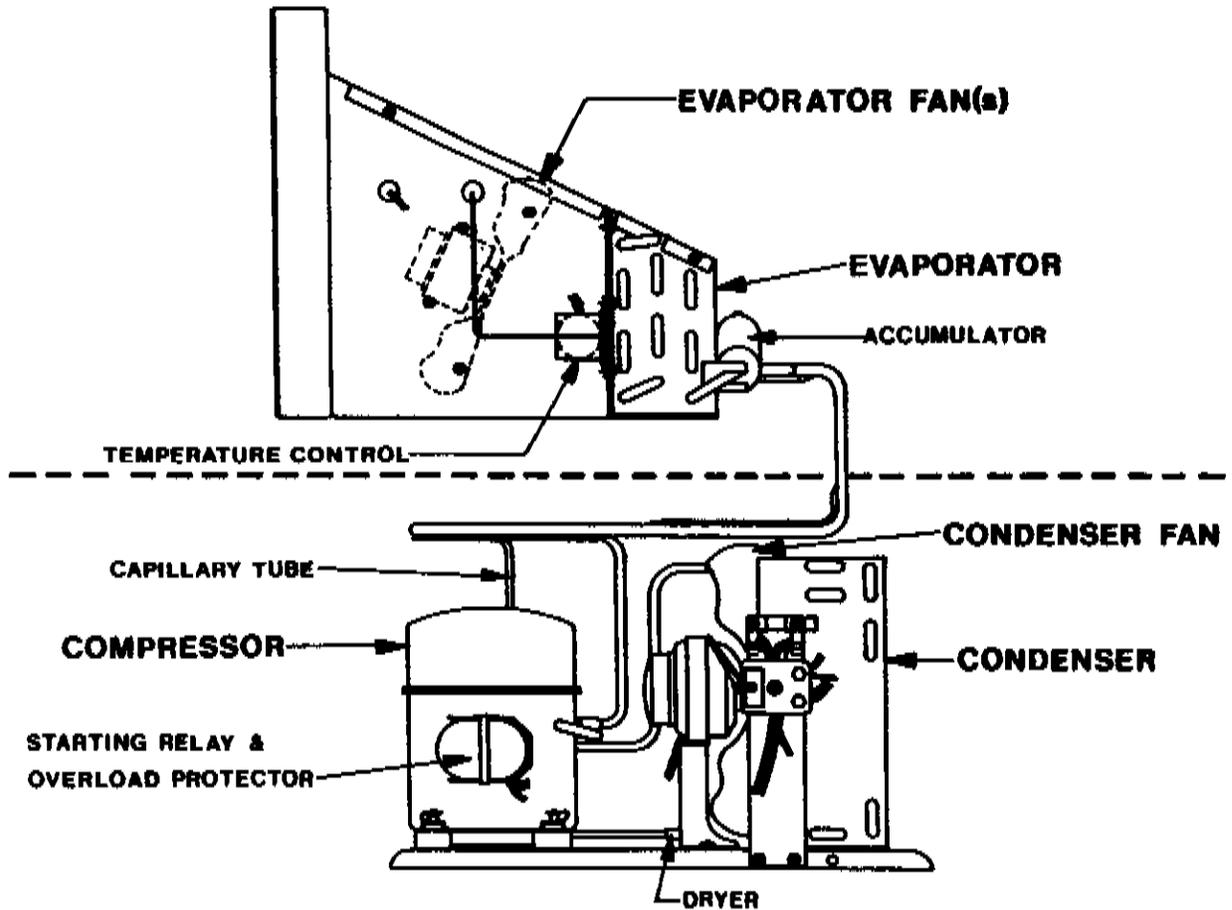

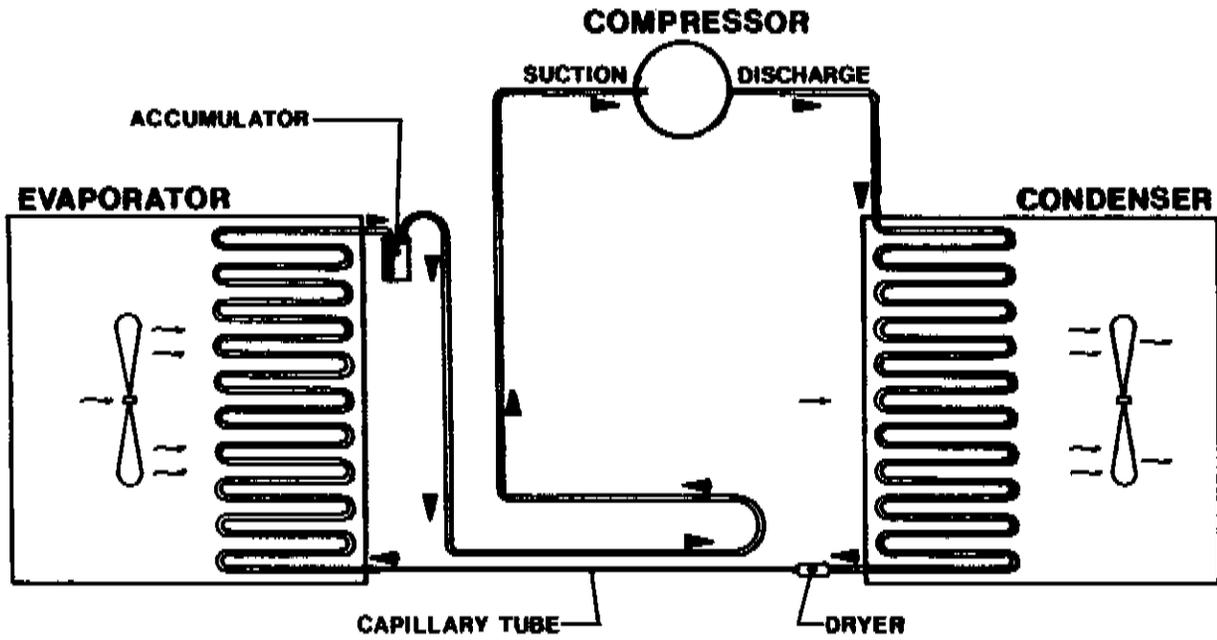

The following cycle is a detailed description of a complete refrigeration cycle as it pertains to the refrigeration system installed in Vendo equipment.

As the temperature in the cabinet rises the liquid in the thermostat feeler bulb also rises in temperature. As this liquid becomes warmer it expands. This expanding liquid pushes against the temperature control bellows and actuates the temperature control switch. The temperature control switch turns both the compressor and condenser fans on. The condenser fan sucks air through the condenser, removing heat from the refrigerant in the condenser. The compressor sucks low pressure refrigerant vapors from the evaporator, compresses it and pumps it to the condenser (where excess heat is removed). The cooled gas in the condenser turns into a liquid. The high pressure from the compressor pumps this liquid through the drier (which removes any moisture and solid particles from liquid) and capillary tube (which controls flow of liquid) to the evaporator. At the evaporator the fan(s) blow the air of the cabinet over the evaporator, removing excess heat from the air. The liquid is heated up and boils turning into vapor which is sucked into the compressor through the accumulator (which traps and allows evaporation of any liquid refrigerant after leaving evaporator) and suction line. The now falling temperature in the cabinet cools the liquid in the thermostat feeler bulb condensing it. As this liquid condenses, it releases the pressure against the temperature control bellows, de-actuating the temperature control switch. The de-actuated control switch turns off the compressor and condenser fans.

## C. PARTS DESCRIPTION. SEE FIGURE 44

### 1. Compressor (Part of a Sealed System - see Parts Section for part numbers)

The Compressor sucks in low pressure vapor from the evaporator and pumps out high pressure vapor to the condenser. The motor that drives the compressor is sealed inside a housing along with the compressor. The compressor is mounted to the refrigeration base, which is mounted in the bottom of the vender - outside the "sealed" refrigerated space.

2. Condenser (Part of a Sealed System)

The Condenser takes heat out of the high pressure vapor that has come from the compressor. As this vapor passes through the condenser it is changed into a liquid because it loses heat while remaining under high pressure. The condenser is mounted to the refrigeration base towards front of vender.

3. Condenser Fan Assembly (Various part numbers - see Parts Section)

The Condenser Fan pulls "cool" air from outside the vender, through the condenser and blows it out the back of the vender (and over compressor). This "cool" air removes excess heat from refrigerant in the condenser. The condenser fan runs when the compressor runs. This fan assembly is mounted on the refrigeration base between the condenser and compressor.

4. Drier (Part of a Sealed System)

The Drier is a molecular sieve strainer drier. It removes water from refrigerant liquid. The drier also removes any solid particle that may have been accumulated by refrigerant liquid. It is mounted in the discharge line of condenser before capillary tube. If the system is tapped, this drier should be replaced to keep the system maintained.

5. Capillary Tube (Part of a Sealed System)

The Capillary Tube has a very small inside diameter to help keep pressure in evaporator low and pressure built up in condenser. It also controls, but at a steady rate, the flow of refrigerant liquid to evaporator. It is the connecting line between the condenser and evaporator.

6. Evaporator (Part of a Sealed System)

The Evaporator removes the heat from the air in refrigerated space and transfers it to the refrigerant liquid. This liquid is evaporated into a vapor and is sucked out by the compressor. The evaporator is mounted inside the refrigerated space directly below the delivery chute.

7. Accumulator (Part of a Sealed System)

The Accumulator traps any refrigerant liquid that did not boil off into a vapor before it reaches the compressor. It allows any refrigerant liquid to boil off as a vapor to prevent damage to compressor. It is mounted in the suction line on the discharge side of evaporator.

8. Evaporator Fan Assembly (Various Part Numbers/See Parts Section)

The Evaporator Fan blows air of refrigerated space over evaporator to remove excess heat from air. The air is then used to remove excess heat from product. The evaporator fan assembly is mounted to the evaporator mounting housing and pulls air from front of refrigerated space over evaporator, up rear of refrigerated space to vend stack.

9. Temperature Control (Various part numbers - see Parts Section)

The Temperature Control is made of two main parts: The thermostat feeler bulb and the Temperature control box. The feeler bulb is a very narrow tube with a refrigerant liquid inside. It is mounted to the evaporator (above air flow of fan) and to the control box. As the liquid in the feeler bulb expands (warms up) it expands against a bellows in the control box, which actuates a temperature control switch (also located in the control box). As the liquid in the feeler bulb cools off it contracts to turn the switch off. This switch turns the compressor and condenser fans on and off. The temperature control box is mounted to the side of the evaporator and is adjustable to control temperature of refrigerated space.

10. Starting Relay (Various part number - see Parts Section)

The Starting Relay is mounted in the terminal box on the side of the compressor housing. When the compressor first starts up the starting relay closes and completes a starting circuit. When the compressor motor gets up to speed, the starting relay opens and brakes the starting circuit.

11. Thermal Overload Switch (Various part numbers - see Parts Section)

The Thermal Overload is mounted in the terminal box on the side of the compressor housing. If the compressor motor gets hot or draws too much current, the thermal overload opens and breaks the starting and running circuits of the motor. When the compressor cools off the thermal overload closes to allow compressor to run.

## MAINTENANCE

The following section deals with general maintenance and servicing of the vender. It is intended as a basic guide only.

This section is divided into five parts: (I) Preventative Maintenance suggestions; (II) Lubrication Guide; (III) Care and Cleaning; (IV) General Overview and Service Suggestions; (V) Basic Trouble Shooting.

### I. PREVENTATIVE MAINTENANCE SUGGESTIONS

The following service call suggestions are given as steps to be taken whenever a vender is visited on site. They are provided as a "preventative maintenance" i.e. to help "prevent" major problems with the vender.

- A. Observe Vender and Surrounding Area for any unusual indications of problems. (Such as rust on cabinet, obstructions of air flow, dark spots on sign face, etc.)
- B. Open Door and Visually Check inside of vender. (Such as water accumulation, rust marks, moisture around edges of inner door, etc.)
- C. Check Fluorescent Lamps (replace as necessary\*\*).
- D. Check Product Temperature for proper cooling.
- E. Check Evaporator Drain for Obstruction. (Water in evaporator area must drain to condensate pan.)
- F. Empty Condensate Pan.
- G. Clean Condenser (Vanes free of dirt, lint or any other obstruction).
- H. Evaporator Fan(s) run normally.
- I. Compressor and Condensate Fan run normally.
- J. Investigate any Unusual Sounds (such as fan blades hitting something, refrigeration lines rattling, etc.).
- K. Clean Coin Acceptor.
- L. Deposit Coin (\$.05, \$.10, \$.25) to check for proper operation of coinage.
- M. Test Vend All Selections.
- N. Correct All Problems (as necessary).
- O. Test Vender and Make a Report on Problems.

**\*\*CAUTION NOTE:** It will be necessary to replace single pin ("Slimline") lamps immediately (within 24 - 48 hours of burning out) to prevent ballast from also burning out.

### II. LUBRICATION GUIDE (SEE CHART BELOW)

Lubricate indicated areas at intervals shown on chart.

#### LUBRICATION CHART

<u>INTERVAL</u>	<u>PARTS</u>	<u>LUBRICANT</u>
Every 6 months	Top Hinge of Door Door Hinge Pin at base of cabinet Door Latch Cam to cabinet strike	Grade 2 High Low Temperature Grease
Whenever Necessary	Shelf Assembly Pivots Shelf Assembly Rollers Eccentric Bearing	Grade 2 High Low Temperature Grease

## III. CARE AND CLEANING

### A. GENERAL PROCEDURE (Painted Metal Areas)

Wash vender with soap and water. The exterior may be waxed with any good automobile wax.

NOTE: Interior corrosion may be removed with a fine grade of steel wool and then painting.

### B. FRESH PAINT SPLASHES, GREASE, AND GLAZING COMPOUND REMOVAL.

Before drying these conditions may be easily removed by rubbing lightly with VM&P grade Naptha (or equivalent grade solvent). After removal, use general cleaning procedure ("A" above).

NOTE: Almost all organic solvents or alcohols are NOT compatible cleaning materials for Lexan signs. Care must be takes to use these materials only on painted surfaces.

### C. LABEL AND STICKER REMOVAL

The use of kerosene, VM&P grade Naptha, or petroleum spirits are generally effective against these conditions. **IMPORTANT:** See note in section "B" above.

In cases where the label material does not allow penetration of solvent (such as vinyl) the application of heat (example: hair dryer) will soften the adhesive and promote removal. **CAUTION:** Excessive heat can cause surface damage.

After label material is removed use general cleaning procedure ("A" above).

### D. SCRATCH REMOVAL

Hairline scratches and minor abrasions can be removed (or minimized) by using any good quality automobile polish. Prior to general use, it is suggested that a sample product be tested first.

### E. LEXAN SIGNS

When cleaning the Lexan sign faces the following cleaning procedure is recommended:

- 1) Wash sign with a mild soap or detergent and lukewarm water.
- 2) Using a soft cloth or sponge, gently wash the sign. DO NOT SCRUB!
- 3) Rinse well with clean lukewarm water.
- 4) Dry thoroughly with a chamois or cellulose sponge (to prevent water spotting). DO NOT USE SQUEEGEE!

NOTE: Almost all organic solvents, petroleum, spirits, or alcohol are NOT compatible cleaning materials for Lexan signs. Usage of any of these materials on Lexan sign could permanently damage sign.

### F. REFRIGERATION AREA

The condenser and evaporator must be kept clean for efficient operation. You must be sure that all vanes and tubing are clean and clear of obstruction to allow free air passage. Clean with a brush, a vacuum cleaner or compressed air. Cabinet drain must be kept open, clean as necessary.

## G. GENERAL CAUTIONS.

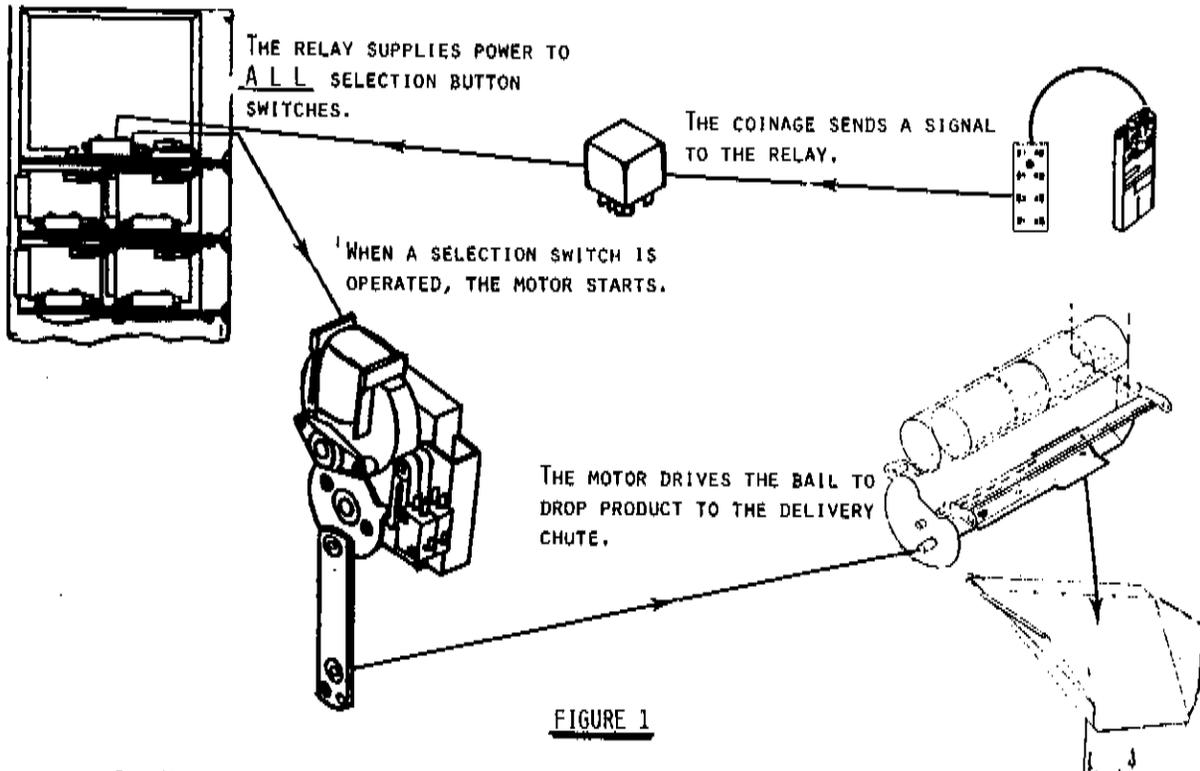

- 1) Do not use abrasive cleaners, highly alkaline cleansers; benzene, leaded gasoline, acetone, or carbon tetrachloride.
- 2) Never scrape with razor blades or other sharp instruments.
- 3) DO NOT clean in hot sun or at elevated temperatures.
- 4) Caution should be taken when working with the Electronic Selection Board (P/N 387879 or P/N 388368). When you plan to trouble shoot, or replace it, line voltage (power) should be removed from the vender.
- 5) Care should also be taken to remove this board if you plan to wash down the interior of this vender to clean it with water.

## IV. GENERAL OVERVIEW AND SERVICE SUGGESTIONS

### THE COINAGE

THE COINAGE ON A "SINGLE PRICE" VENDER PERFORMS THREE FUNCTIONS DIRECTLY RELATED TO THE VENDERS CIRCUIT.

1. WHEN THE COINAGE HAS RECEIVED AND ACCEPTED THE CORRECT AMOUNT OF MONEY, IT SENDS A MOMENTARY ELECTRICAL PULSE TO THE VENDER CREDIT RELAY TO ENERGIZE IT (COINAGE PINS #1 AND #3, SEE FIGURE 1).

2. WHEN THE COINAGE CIRCUITS RETURN TO STANDBY, THEY PROVIDE A SELECTION CIRCUIT THROUGH THE VENDER CREDIT RELAY ENERGIZED TO ALL SELECTION BUTTON SWITCHES (SEE FIGURE 2).
3. WHEN THE VENDER CREDIT RELAY IS ENERGIZED OR THE VENDER IS SOLD OUT ON ALL SELECTIONS, THE VENDER TELLS THE COINAGE "DO NOT TAKE MONEY". THE COIN PATHS IN THE COINAGE REMAIN BLOCKED EITHER MECHANICALLY OR ELECTRONICALLY DEPENDING ON THE TYPE OF COINAGE USED.

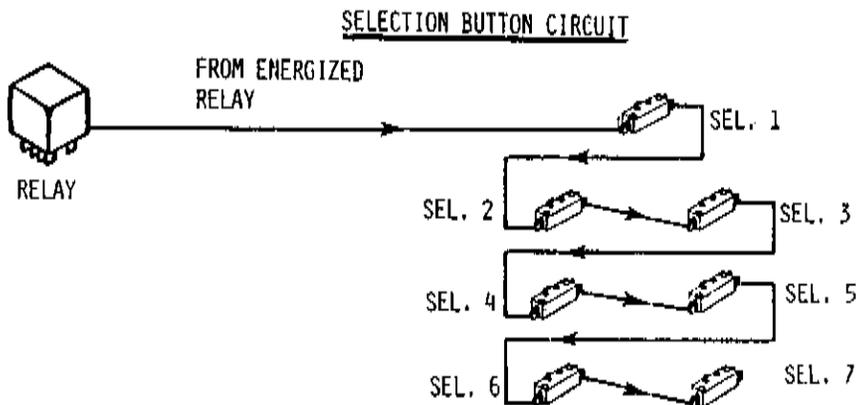

FIGURE 2

## THE RELAY

THE VENDER CREDIT RELAY IN ITS STANDBY (DE-ENERGIZED) CONDITION PROVIDES A CIRCUIT TO THE COINAGE ACCEPTOR AREA TO ALLOW THE COINAGE TO ACCEPT COINS. WHEN IT RECEIVES THE MOMENTARY ELECTRICAL PULSE FROM THE COINAGE, IT WILL STAY ENERGIZED IF THE L1 (LINE-ONE) MOTOR CARRIER SWITCH CIRCUIT IS COMPLETE. THIS IS CALLED THE CREDIT RELAY HOLD CIRCUIT. (SEE FIGURE 3)

THE MOST EFFICIENT WAY TO CHECK THE RELAYS EFFECT ON ANY PROBLEM IS TO REPLACE THE RELAY.  
-IF THIS DOES NOT CORRECT THE CONDITION-

POSSIBLE PROBLEM	SERVICE SUGGESTION
1. THE RELAY MAY FAIL TO ENERGIZE.	1. CHECK THE COINAGE.
2. THE RELAY MAY ENERGIZE AND FAIL TO HOLD.	2. CHECK THE MOTOR CARRIER SWITCHES.
3. THE RELAY MAY ENERGIZE AND FAIL TO ALLOW A SELECTION TO BE MADE.	3. CHECK THE COINAGE AND THE VENDER HARNESS.
4. THE RELAY MAY DE-ENERGIZE AND FAIL TO COMPLETE A CIRCUIT TO THE COINAGE ACCEPT CIRCUIT.	4. CHECK THE VENDER HARNESS.

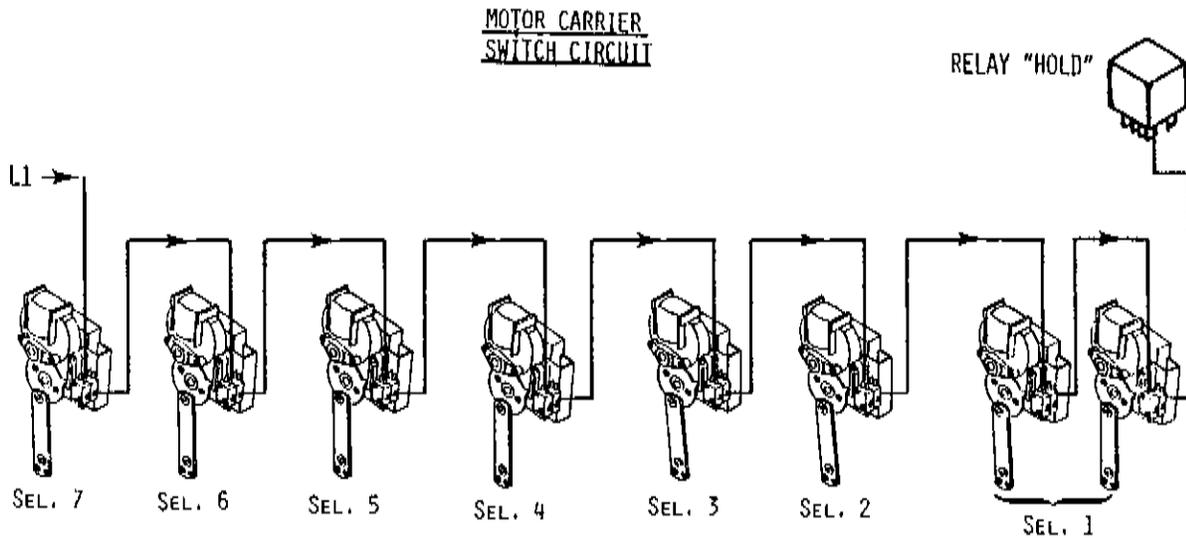

FIGURE 3

## THE SELECTION BUTTON SWITCH

EACH SELECTION BUTTON SWITCH IS CONNECTED TO ITS MOTOR THROUGH ITS SOLD OUT SWITCH "A". IF THE VENDER CREDIT RELAY IS ENERGIZED, ALL SELECTION BUTTON SWITCHES ARE CONNECTED LI (LINE-ONE) STARTING WITH SELECTION ONE AND CONTINUING THROUGH #2, #3, #4, #5, #6 AND #7, AS SHOWN IN FIGURE 2. WHEN ANY SELECTION BUTTON SWITCH IS OPERATED, THIS LI (POWER) WILL BE DIRECTED TO THE MOTOR SELECTED THROUGH ITS SOLD OUT SWITCH "A" (SEE FIGURE 4).

POSSIBLE PROBLEM	SERVICE SUGGESTION
<p>SELECTIONS #1, #2, #3 AND #4 WORK PROPERLY BUT #5, #6 AND #7 DO NOT WORK. IF THE SOLD OUT LIGHTS #5, #6 AND #7 <u>DO NOT LIGHT</u> WHEN SELECTED.</p>	<p>CHECK CONTINUITY BETWEEN N.C. OF SELECTION SWITCH #4 AND C OF SELECTION SWITCH #5.</p> <p>IF THERE IS NO CONTINUITY, THE PROBLEM IS SELECTION SWITCH #4 OR THE 4 TO 5 JUMPER WIRE. IF THERE IS CONTINUITY, THE PROBLEM IS THE #5 SWITCH.</p>

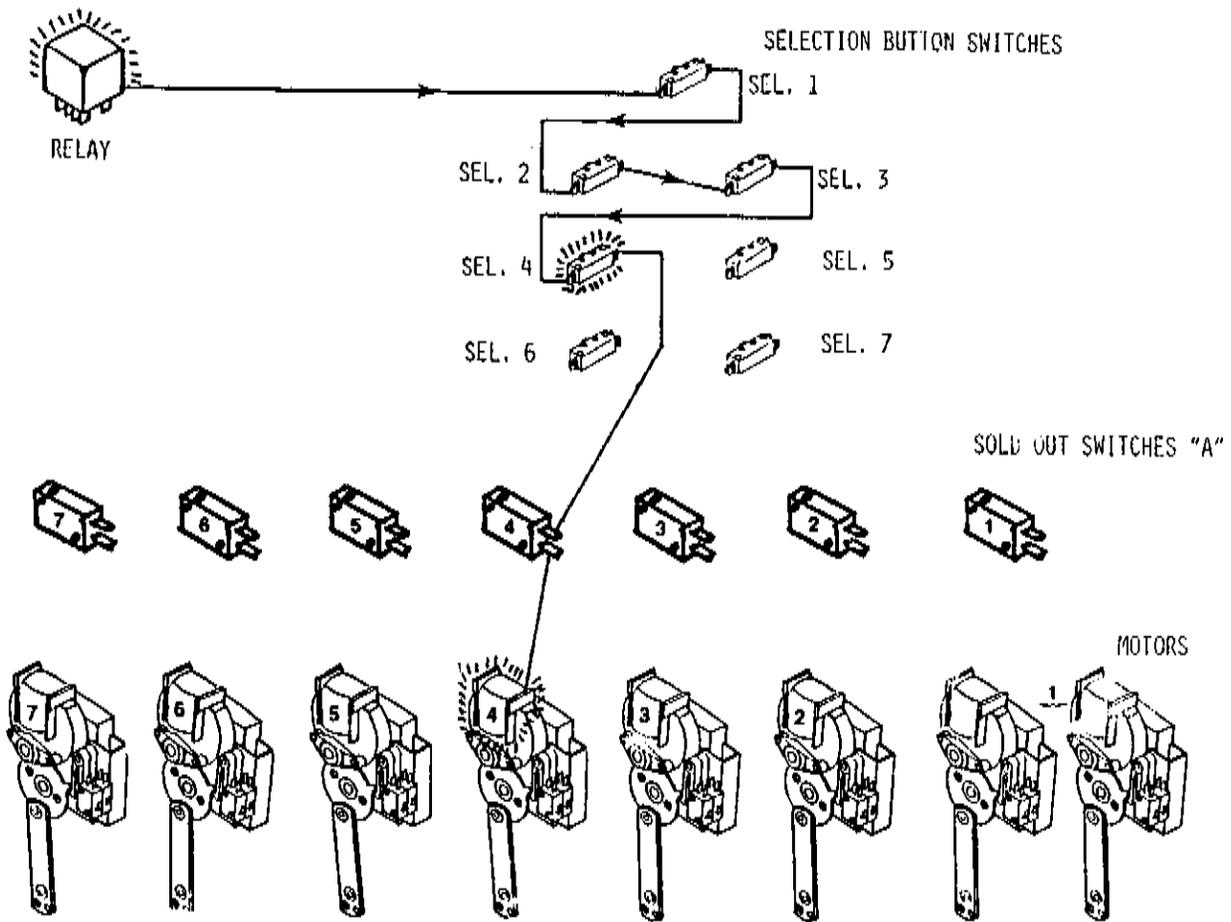

FIGURE 4

## THE MOTOR CARRIER SWITCH

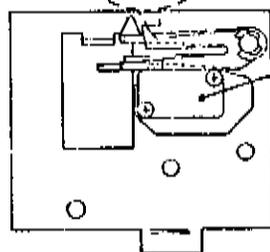

A LOBE ON EACH MOTOR CAM HOLDS THESE SWITCHES IN A COMMON-NORMAL OPEN POSITION AT STANDBY. THEY PROVIDE A "CREDIT HOLD" FOR THE ENERGIZED CREDIT RELAY (SEE FIGURE 3). WHEN A MOTOR STARTS, ITS MOTOR CARRIER SWITCH IS OPERATED TO COMMON-NORMAL CLOSED TO DE-ENERGIZE THE CREDIT RELAY AND KEEP ITS MOTOR RUNNING UNTIL THE NEXT CAM LOBE HITS THE ACTUATOR TO RETURN THE MOTOR CARRIER SWITCH TO STANDBY (STOPS ITS MOTOR).

POSSIBLE PROBLEM	SERVICE SUGGESTION
A MOTOR STARTS AND FAILS TO STOP WHEN THE NEXT LOBE REACHES THE ACTUATOR (A DOUBLE VEND OCCURS).	ADJUST THE SWITCH CLOSER TO THE CAM. IF THIS DOES NOT CORRECT, REPLACE THE SWITCH.

## THE BYPASS SWITCH

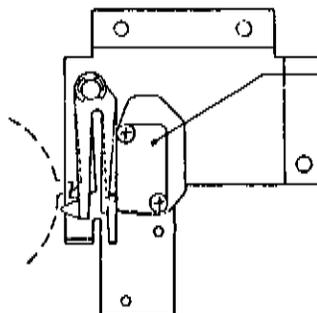

EACH VEND MOTOR HAS A BYPASS (SAFETY) SWITCH. ITS PURPOSE IS TO INSERT A BYPASS CIRCUIT INTO THE VENDER CREDIT RELAY HOLD CIRCUIT IF A VEND MOTOR DOES NOT RETURN TO STANDBY (THE MOTOR FAILS OR PRODUCT JAMS). THIS BYPASS CIRCUIT WILL ALLOW ALL OTHER SELECTIONS TO FUNCTION NORMALLY UNTIL REPAIRS CAN BE MADE. THE BYPASS AND MOTOR CARRIER SWITCHES ARE MOUNTED TOGETHER. THE PHYSICAL POSITION OF THE SWITCHES ARE NOT THE SAME IN ALL COLUMNS (SEE FIGURE 5).

POSSIBLE PROBLEM	SERVICE SUGGESTION
IN A NORMAL VEND CYCLE, THE VENDER CREDIT RELAY DOES <u>NOT</u> DE-ENERGIZE.	PROBABLE CAUSE: THE BYPASS SWITCH DID NOT ACTUATE MOMENTARILY AT THE START OF THE CYCLE. ADJUST OR REPLACE THE SWITCH.
A VEND MOTOR STOPS IN MID CYCLE THE VENDER WILL NOT ACCEPT MONEY.	REPLACE THE BY-PASS SWITCH.

SINGLE COLUMN

SWITCHES: CARRIER SWITCH IN FRONT WITH BYPASS SWITCH IN BACK OF CARRIER SWITCH.

STAGGERED COLUMN

SWITCHES: CARRIER SWITCH IN BACK WITH BYPASS SWITCH IN FRONT OF CARRIER SWITCH.

FIGURE 5

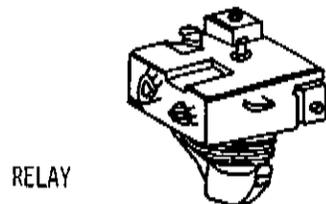

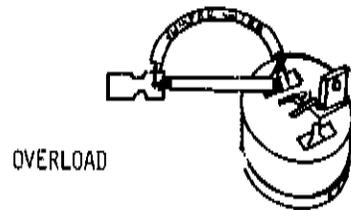

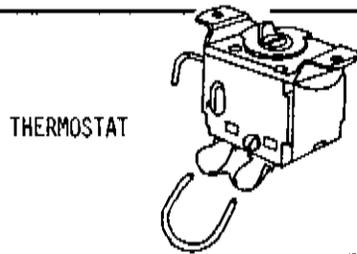

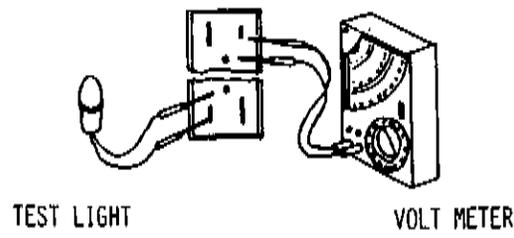

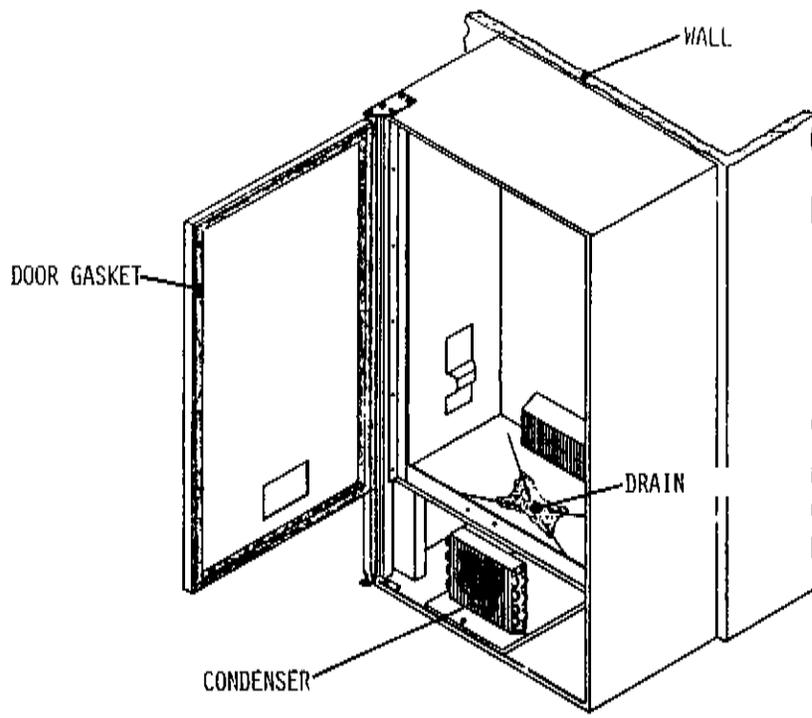

## REFRIGERATION

### BASIC SERVICE SUGGESTIONS

THE MOST COMMON CAUSES FOR CABINET TEMPERATURE BEING ABOVE NORMAL ARE:

1. FAILURE TO ELIMINATE MOISTURE FROM THE REFRIGERATION AREA.
  - A. DOOR GASKET NOT SEALING PROPERLY.
  - B. CABINET DRAIN STOPPED UP.
2. IMPROPER AIR FLOW THROUGH THE UNIT CONDENSER.
  - A. NO "VENT" SPACE AT THE REAR OF THE CABINET.
  - B. CONDENSER BLOCKED BY DUST, LINT, OR DIRT

OTHER CONDITIONS	SERVICE PROCEDURE
<p>THE DISPLAY LIGHT IS <u>NOT ON</u> AND <u>NO MOTORS ARE RUNNING.</u></p>	<p>CHECK THE POWER SUPPLY AT THE WALL SOURCE (VOLT METER OR TEST LIGHT)</p>
<p>THE MOTOR INSIDE THE CABINET (EVAPORATOR) IS <u>RUNNING</u> BUT THE FAN MOTOR ON THE UNIT (CONDENSER) IS NOT RUNNING.</p>	<p>CHECK THE THERMOSTAT (COLD CONTROL). <u>DISCONNECT POWER FROM VENDOR.</u> USE AN INSULATED JUMPER WIRE ACROSS THE TERMINALS OR CONNECT A KNOWN GOOD CONTROL. <u>REAPPLY POWER.</u> IF UNIT STARTS REPLACE THE CONTROL.</p>
<p>IF THE FAN MOTOR ON THE UNIT IS <u>RUNNING</u> - THE COMPRESSOR IS <u>COOL</u> TO THE TOUCH AND NOT RUNNING.</p>	<p>CHECK THE OVERLOAD. <u>DISCONNECT POWER FROM THE VENDOR.</u> USE AN INSULATED JUMPER WIRE ACROSS THE TERMINALS OR CONNECT A KNOWN GOOD OVERLOAD. <u>REAPPLY POWER.</u> IF THE UNIT <u>STARTS</u> REPLACE THE OVERLOAD. IF THE UNIT <u>DOES NOT START</u> REPLACE THE RELAY.</p>
<p>IF THE FAN MOTOR ON THE UNIT IS <u>RUNNING</u> - THE COMPRESSOR IS <u>HOT</u> TO THE TOUCH AND <u>IS NOT RUNNING.</u></p>	<ol style="list-style-type: none"> <li>1. DISCONNECT POWER AND ALLOW COMPRESSOR TO COOL.</li> <li>2. REPLACE THE RELAY AND REAPPLY POWER.</li> <li>3. IF UNIT <u>DOES NOT START,</u> REPLACE THE UNIT</li> </ol>

## V. TROUBLE SHOOTING GUIDE

The following Trouble Shooting Section is intended as a basic GUIDE (only!!) to Trouble Shoot Vendo Equipment.

### CAUTION

The Vendo Electronic Selection Board contains circuitry that is subject to damage by static discharge, certain components are elevated off the board and can easily be damaged if care is not taken when handling these boards in make any necessary replacements.

1. These boards are packed in a protective package when a replacements is ordered from Vanguard and should be kept in this package until used.
2. Do not remove the boards from this wrap, to replace the old board, apply the new board by holding it in place with the wrap rather than contacting it with your hands, because of the possible static build up you may have in your body, which will be released to the board if this is not followed.
3. Use no nylon or static generating material that can come into contact with the board.

The Trouble Shooting Guide is done in chart form. It has three (3) columns. The first column lists a possible problem, the second column lists possible cause(s) of that problem and the third column lists the recommended suggestion to solve that cause for that problem.

For any service problems with Vendo equipment contact THE VENDO COMPANY, 7209 N. INGRAM, FRESNO, CALIFORNIA 93650 or call toll free (800) 344-7216, in California call (800) 742-1815. Also available is a small (shirt pocket size) Training - Trouble guide (P/N 387647). Order from the Vendo Parts Department at the above address or phone number.

POSSIBLE PROBLEM	POSSIBLE CAUSE	SERVICE SUGGESTION
RETURN ALL GOOD COINS.	NO POWER TO VENDER	CHECK POWER SUPPLY
	NO POWER TO CHANGER	CHECK COIN MECHANISM PLUGS CHECK FOR FAULTY HARNESS WIRING (SEE WIRING DIAGRAM FOR CIRCUIT)
	ACCEPTOR IS OUT OF ADJUSTMENT OR COIN GATE IS NOT CLOSED.	CHECK COIN MECHANISM
	BLOCKING FINGERS REMAIN IN COIN PATH DUE TO: (1) DEFECTIVE COIN RETURN ELECTRO MAGNETIC (C.R.E.M.) (2) BENT BLOCKING FINGERS.	1) CHECK C.R.E.M. REPLACE  2) REFORM BLOCKING FINGERS
	COIN PATHS ARE DIRTY	CLEAN ACCEPTOR WITH APPROVED CLEANER. <u>DRY VERY THOROUGHLY!</u>
	CONTACTS OF CREDIT RELAY OPEN	CHECK CONTINUITY OF RELAY. CLEAN CONTACTS WITH APPROVED ELECTRICAL CLEANER. IF STILL OPEN - REPLACE RELAY.
	OPEN MOTOR CARRIER CIRCUIT OR START BYPASS CIRCUIT	CHECK THAT MOTOR CARRIER AND BYPASS SWITCHES HAVE RETURNED TO STANDBY.

POSSIBLE PROBLEM	POSSIBLE CAUSE	SERVICE SUGGESTION
MONEY ACCEPTED, NO PRODUCT VENDED	CREDIT RELAY DOES NOT ENERGIZED	CHECK RELAY, REPLACE RELAY
	NO SELECTIONS WORK	CHECK #1 SELECTION SWITCH - REPLACE IF NECESSARY
	#1 SELECTION WORKS 2 THRU LAST DOES NOT	CHECK #2 SELECTION SWITCH - REPLACE IF NECESSARY THIS PATTERN CAN CONTINUE THRU LAST SELECTION SWITCH AS SELECTION CIRCUIT GOES FROM 1 TO 2 TO 3 ETC. TO LAST.
	SOLD OUT SWITCH "A" INOPERATIVE	CHECK SWITCH REPLACE
	MOTOR DOES NOT START	CHECK START/BYPASS SWITCH REPLACE SWITCH
	MOTOR STARTS, BUT DOES NOT RUN	CHECK MOTOR CARRIER SWITCH, REPLACE SWITCH.
VEND MOTOR RUNS UNTIL TWO OR THREE PRODUCTS ARE VENDED OR VEND MOTORS RUN CONTINUOUSLY	IMPROPER CAM LOBE ADJUSTMENT	CHECK CAM FOR PROPER ARRANGEMENT OF CAM LOBES (SEE PRODUCT SET UP GUIDE)
	MOTOR CARRIER SWITCH NOT MAKING CONTACT WITH CAM LOBE OR SWITCH.	CHECK LEVER FOR PROPER LEVER POSITIONING AND FREEDOM OF MOVEMENT.
MULTI VENDS	SHORTED TRIAC	REPLACE BOARD
VENDER WILL NOT VEND	OPEN TRIAC	REPLACE BOARD

POSSIBLE PROBLEM	POSSIBLE CAUSE	SERVICE SUGGESTION
REFRIGERATION UNIT WILL NOT RUN AT ALL	NO POWER TO VENDER	CHECK POWER SUPPLY, ALSO CHECK SERVICE CORD CONNECTIONS.
	THERMOSTAT OPEN (TEMPERATURE CONTROL)	CHECK THERMOSTAT (APPLY INSULATED JUMPER ACROSS TERMINALS IF COMPRESSOR STARTS, REPLACE THERMOSTAT).
	TEMPERATURE CONTROL BULB OUT OF POSITION	CHECK THAT BULB IS IN AIR FLOW
COMPRESSOR WILL NOT START,	OVERLOAD PROTECTOR INOPERATIVE	CHECK OVERLOAD (APPLY INSULATED JUMPER ACROSS TERMINAL, IF
CONDENSER FAN MOTOR RUNNING - UNIT COOL (NO POWER TO COMPRESSOR)		COMPRESSOR STARTS, REPLACE OVERLOAD)
COMPRESSOR WILL NOT START, CONDENSER FAN MOTOR RUNNING - UNIT HOT (POWER TO COMPRESSOR)	STARTING RELAY INOPERATIVE	CHECK RELAY, REPLACE.
	COMPRESSOR INOPERATIVE	DISCONNECT POWER TO VENDER REMOVE ALL LEADS FROM COMPRESSOR. CHECK CONTINUITY FROM "COMMON", "START", AND "RUN" TO COMPRESSOR CASE. IF CONTINUITY SHOWS, REPLACE COMPRESSOR. ALSO CHECK FROM "COMMON" TO "RUN" AND FROM "COMMON" TO "START". (USING CONTINUITY OR OHMS.) IF METER FAILS TO SHOW READING REPLACE COMPRESSOR.

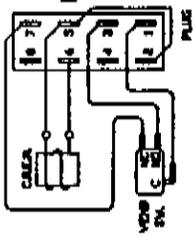

POSSIBLE PROBLEM	POSSIBLE CAUSE	SERVICE SUGGESTION
COMPRESSOR STARTS BUT DOES NOT RUN	WILL NOT CYCLE	CHECK OVERLOAD AND CONTACTS - REPLACE OVERLOAD IF NECESSARY.
	STARTING RELAY STAYS CLOSED.	REPLACE RELAY.
	THERMOSTAT INOPERATIVE	CHECK THERMOSTAT. CLEAN CONTACTS WITH APPROVED ELECTRICAL CLEANER. REPLACE THERMOSTAT IF NECESSARY.
	COMPRESSOR MOTOR PROBLEM.	CHECK. REPLACE.
COMPRESSOR RUNS BUT CABINET TEMPERATURE WARM	COMPRESSOR FAILURE	REPLACE COMPRESSOR.
	LOSS OF REFRIGERANT	REPLACE REFRIGERATION UNIT (NOTE; ANY WORK OF THIS NATURE DONE WITHOUT EXPRESS PERMISSION FROM THE VENDO COMPANY CAN VOID WARRANTY ON THE REFRIGERATION UNIT.)
	CONDENSER FAN NOT WORKING	CHECK CIRCUIT TO FAN MOTOR. REPLACE MOTOR. CHECK FOR OBSTRUCTION OF FAN BLADE.
	BLOCKED OR DIRTY CONDENSER	CHECK CONDENSER VANES FOR OBSTRUCTION, LINT OR DIRT. CLEAN. ALSO CHECK FOR PROPER AIR FLOW THROUGH REFRIGERATION AREA. (REFER TO INITIAL INSTALLATION OF SERVICE MANUAL.)
	EVAPORATOR FAN NOT WORKING	CHECK CIRCUIT TO FAN MOTOR. REPLACE MOTOR ALSO CHECK FOR OBSTRUCTION OF FAN BLADE.
	BAD INNER DOOR SEAL	CHECK FOR MOISTURE ON SEAL. ADJUST INNER DOOR AS NECESSARY (SEE INITIAL SETUP OF SERVICE MANUAL). REPLACE DOOR SEAL.

POSSIBLE PROBLEM	POSSIBLE CAUSE	SERVICE SUGGESTION
COMPRESSOR RUNS - BUT CABINET TEMPERATURE WARM	THERMOSTAT SET TOO HIGH	ADJUST THERMOSTAT (SEE INITIAL SETUP OF SERVICE MANUAL).
COMPRESSOR RUNS CONTINUOUSLY	THERMOSTAT INOPERATIVE	CHECK THERMOSTAT.
EVAPORATOR FROSTED OVER	WATER AT BASE OF EVAPORATOR UNIT	CHECK FOR PROPER DRAINAGE (SUCH AS PLUGGED DRAIN, KINK IN DRAIN TUBE, ETC.) CHECK DOOR SEAL.
PRODUCT FREEZING UP TOO COLD	THERMOSTAT SET TOO LOW	ADJUST THERMOSTAT (SEE INITIAL SETUP OF SERVICE MANUAL).
	THERMOSTAT INOPERATIVE (COMPRESSOR RUNS CONTINUOUSLY)	CHECK THERMOSTAT, REPLACE IF NECESSARY.
	THERMOSTAT FEELER BULB OUT OF POSITION	ADJUST BULB (SEE INITIAL SETUP OF SERVICE MANUAL).
EXCESSIVE NOISE	FAN BLADES BENT OR HITTING SHROUD	STRAIGHTEN, RELOCATE SHROUD POSITION.
	FAN MOTOR NOISY	TIGHTEN BOLTS OR REPLACE
	REFRIGERATION BASE LOOSE OR BENT	TIGHTEN OR STRAIGHTEN BASE
